This is not entirely correct. Triple conversion is usually only advantageous in a wide-band coverage receiver where the difference in the first IF frequency is less than switching range of (bandwidth) of the receiver. Triple Conversion creates a receiver that is less prone to images but at the expense of decreased sensitivity and greater complexity. The best SSB/CW Receivers are single conversion. Triple conversion is no guarantee that intermodulation products won't be

created in your RF Preamplifier - where most noise in the big city comes from!

Cheers!

3571. FS: PAGER DECODER INTERFACE BEST AVAIL, $20

Newsgroup: rec.radio.scanner
Date: 1997-06-05 00:00:00 UTC
From: atocco8586@aol.com
Message-ID: <19970605234400.TAA28873@ladder02.news.aol.com>
Source record: 195362

This is the best, and the cheapest pager decoder on the market. I tried to make several of the others work with some success. From my experience with these decoders I have gotten together with an engineer an we have designed this decoder completely from scratch. This interface is currently in use with pd203 and has been tested with other software packages. THIS IS THE BEST ON THE MARKET FOR DECODING PAGER TRANSMISSIONS AND ONLY COSTS $20. ASSEMBLED AND READY TO GO. -DECODES POCSAG AND GOLAY --NUMERIC AND TEXT --ALL BAUD RATES. 14 DAY MONEY BACK GUARANTEE.

SEND $20 + $5 S&H TO:

TONY TOCCO

3575. Can you help ID this item? Antenna splitter??

Newsgroup: rec.radio.scanner
Date: 1997-06-05 00:00:00 UTC
From: MacUser@Penn.Com
Message-ID: <MacUser-ya023580000506972007220001@news.penn.com>
Source record: 195366
Cross-posted to: rec.radio.cb,rec.radio.scanner

I�m hoping you may be able to help me identify an antenna connector I have here. I found it in my electronics lost toys box. I forget where it came from and it has no documentation. It would appear to be an AM-FM/CB radio antenna splitter.

Here�s the description:

The device itself is a small aluminum-type of box, round actually, 1.5 inches in diameter and 1.75 inches deep. It has five connectors, all on one flat end. Two are wires; one ends in a type of plug that I believe is called a Motorola plug, the type you would find plugged into the back of your car radio, the other end is what I think is called a PL-259 connector, the type that connects to a standard CB radio. A third connector is a female receiver for a motorola type plug. The fourth and fifth items are small holes in the surface of the box into which you can insert a small allen wrench and apparently make some adjustments. The adjustments might each be related to one of the wire leads.

The only other distinguishing features of the unit are a number taped on the side, 680000-003, and words written on the cable with the two external connectors that say "Assembled in Dominican Republic with US Materials". No big clue there. No manufacturer or brand of any kind.

It would appear that the intent is to pull the antenna wire from the back of your AM-FM radio and plug it into the box, add this in-line restoring the signal though the Motorola plug cable to the radio, then attach the PL-259 connector to the CB to use the standard car antenna to receive (and maybe even transmit) CB.

I tried this, and while there seemed to be no ill effect whatsoever on the quality of the car radio signal, the CB didn't work worth a darn. I couldn't even get static like I would normally have in the background on the CB with the squelch turned all the way down.

But then I really didn't fiddle with it endlessly either. I just tried it and it didn't seem to work well.

Can anyone provide a positive ID on this device? Has anyone had any experience using one like it with any degree of success?

- Dave

>why

From what some hams who post here do post, one could wonder WHY
they have a ham license. So what ?

Depending on the topic of discussion, having a license does help in the credibility department, but as it has been pointed out many times, you don't need a license to post here. This is usenet, not ham radio. There aren't any stupid questions pertaining to ham radio. Since it's a hobby/service that attracts people from all occupations, many beginners have questions that may appear 'basic' to people with electronics or radio experience, but that in no way makes the questions 'stupid'. With all the online callbooks available on the internet, and with all the information Masa has provided in his messages, it should be real easy for you to go look up his callsign if you really need to know what it is. Keeping callsigns a 'secret' is a phenomenon that seems to be found here in usenet - most hams plaster their call sign all over the place, but for some reason that doesn't happen.

Your message makes me wonder WHY you have such a burning desire to know if Masa has a 'legal' ham license. Have you just been appointed Chief of the Internet Radio Police Department ?

A simple case of front end overload. Only the most exotic (and
expensive) radios will operate normally when you are very close to
another transmitter, it does not have to be on the same frequency, the
radio simply can't handle a signal that strong from that close,
especially an inexpensive CB rig. Ham contesters routinely pay up to
$5000 per radio or more for high performance rigs that will function
somewhat normally under contest conditions when they get 4 or 5 rigs
going at the same time on different bands, in the same room. Learn to
live with it. You could get a top of the line CB, such as a Uniden PC76
which will do a much better job of it than your current radio.

Hi Bob,

You may want to check out 455.9125 for Metro Traffic Control.

You should check out 460.2625, 455.8000, 455.8250, 450.3500.

You can also hear various aircraft on 122.7500 AM. You can
hear the call out their locations as they pass over major
parts of the I495, I270, I95 and I66.

Bob

3594. Grundig YB-305 On Sale

Newsgroup: rec.radio.scanner
Date: 1997-06-05 00:00:00 UTC
From: cphillips@pobox.com
Message-ID: <5n5h7l$4gi@redstone.interpath.net>
Source record: 195389
Cross-posted to: rec.radio.shortwave,rec.radio.scanner

FYI, for shortwave and scanner fans:

The Grundig Yacht Boy 305 is on sale from DAMARK.
These units are FACTORY RECONDITIONED.
They are NOT new.

They do carry a factory warranty, however.
DAMARK has them on sale for $99.99, (plus $6.99 S&H).
DAMARK's phone number is 800-827-6767 and the item number
for the YB-305 is B-20123-553577.

These units sell new typically for about $130.
Although it does not have quite as many features as the
YB400, it is given pretty high ratings by PASSPORT
and WRTH.
So if you need another or a smaller SW radio, here's
a possibility.

BTW, if you join DAMARK's "Buyer's Club", you
get an extra $10 off. Of course, this would only be
worthwhile if you anticipated buying other things
from DAMARK in the future, because membership in the
"Buyer's Club" costs about $40.

DAMARK does have a 30 day return policy.

I have no connection to DAMARK, except I'm
on their mailing list.

>usally freak at the first sign of blood.....

"Former city cop" hunn? I wonder what would make a guy step down. Usually Police are paid more than fire fighters, and almost always more than EMT's. I work in the city of Atlanta, and have worked in law enforcement for over 17 years and I have meet few officers like you describe.

I have crawled the floors of burning buildings looking for victims, while fire fighters stood on the ground with Scott Airpacks, watching the show. The officer who was with me never fully recovered from problems related to the smoke inhalation.

Very seldom has a ambulance waited on me to transport, we usally must wait on them to quit going over and above "First Aid", in some cases playing doctor. Insted of getting the patient stable, then transporting. There are few Paramedics/Advanced EMTS who do not like to stand around and brag about the procedures they can/have done, that only a doctor should do.

You say that most of the Police in your exsperence can not handle the sight of blood? I wonder what type of law enforcement the guys in your city are doing where they seldom see blood? Back before we knew better, I have had my clothes stiff with it.

To say that officers would keep a person in critical condition waiting for report information, in your area/experience, is hard to swallow. When officers do delay transport, it is never in critical cases. But I too have paperwork to do, and calls holding. Following you across town to a busy ER, waiting on patient check in, then maybe on a doctor exam, to get a Name, address, DOB and phone number, and perhaps DL information is moronic. Others are waiting on help/services.

I get along great with most EMT's, respect most of them a great deal. However, I have to remind more than one, I can always call another ambulance service. They can not call another Officer/Agency to work the scene. Ever wonder why it is set up that way.

I apologise to the group for this off-topic discussion. I should not have responded, and will only resond again via E-mail. But, I have buried to many of my police friends to see there kind slammed by someone who seems to have a Ax to grind. I know of few officers, "former" or otherwise, who would speak of there fellows in such a manor. Thanks. Bill

I went to his web page and he says his call sign is:

VE7JPN

which is interesting coincidence since he came from Japan.
Now, a quick QRZ look up shows that there is no VE7JPN, and that the
VE7xxx's are in VE7Ixx....

So, the question begs: Is he legal?

Your call....

I found that out today. Of course as soon as I discovered it was a cell
phone call, I IMMEDIATELY turned off my unit, and promised to never
monitor another cell-phone call no matter HOW INTRUSIVE THEIR SIGNAL IS.
In fact, I can no longer use a cheap AM radio I had since the front-end
was being over-loaded by a strong cell site.

I printed this message and I work in Austin Tx..
I will give hime a call for you to try and help you resolve this issue.
Do you have the Tel of the company that issued the Money Order.
I think the company may beable to bring up fraud charges on this
individual. I also work at the Austin Courthouse and will do some
checking for you on how to bring this individual on charges.
In the mean time I will need the # of the money order and where it was
purchased from.

PROBE is wonderful software, and you cannot beat the support that you get. I was not all convinded I'd like it either, but I tried it, and it works 1000% better than any other software on the market. To answer your question, it even runs on my HP200LX, which is a 186.

For your multi5tasking if MessageTracker is for dos, you'd be better off running OpenDOS 7.0 (www.caldera.com) It's a FREE version of dos with full multitasking support. It also works quite well, but you have to be well-aq\uainted with dos.

Hope this helps,

OOooooh, I agree on the Killian's ! But some LaBatt's Blue is a decent second choice. As far as an antenna for mobile use...I use a dual-band glass mount from Radio Shack. It works pretty good, and supposedly has gain. I used a glass mount so the magnet would not not mess up the paint on my truck. Anyhow, the antenna is $30 and I think is made for them by Valor/Pro-Am

yes. now you know that I am a legal amateur. go away and get a life. the perception is not a reality. you thought i wasn't a amateur ?? i strongly recommend you not to assume.

after you find out the fact, you blame for the fact. well and well.... *sign* this is how our society works !!!!!

>Now, a quick QRZ look up shows that there is no VE7JPN, and that the
>VE7xxx's are in VE7Ixx....

because I am a new amateur. please go DIRECTLY to Industry Canada's call sign database if you want to find out.

>So, the question begs: Is he legal?

yes. the perception is not reality. what you think may not be all the time. please do not assume who I am without talking with me..... you don't who I am...

>Your call....

are you talking to me or someone else ? it is not accurate to ask someone else you don't know, you know ?

>John KC5VEI

KC5VEI ? I have to find out that you are not an amateur !!!!! you are illegal !!!!! (that's what you are telling me..... what do you think ? you don't think it is stupid ????? if you blame, I

blame you back !!!!! .)

According to Greg Knox, it does need all frequencies. Whether it's due
to a copyright or complexity, I don't recall. But I don't consider it
a bug. If you can't find all the freq's for a city, you aren't looking
hard enough.

3625. TrunkTracker answers

Newsgroup: rec.radio.scanner
Date: 1997-06-05 00:00:00 UTC
From: jtward11@aol.com
Message-ID: <19970605144501.KAA13034@ladder02.news.aol.com>
Source record: 195420

THE FOLLOWING WAS POSTED TO THE SCAN-L LISTSERVER BY GREG KNOX, THE PERSON WHO DEVELOPED THE PROGRAMMING USED BY THE UNIDEN 235XLT TRUNKTRACKER

Trunktracker displays Motorola talk group IDs as decimal values. It was not possible to make a 7 segment LCD character, gracefully handle the alphanumerics that would be required for a HEX display.
If you want to convert the decimal value displayed by the scanner to its equivalent Motorola talkgroup value, divide the decimal value by 16 and convert the result to a 3 place (leading zeroes may be required) hexadecimal result. Some examples:

```
Trunktracker Motorola
--------------------------
16 001
32 002
48 003
496 01F
1040 041
2416 097
11536 2D1
12880 325
65520 FFF
```

Note that this assumes that the decimal value is an integral multiple of 16. This should be the case for a Type II group ID. If you've got a system with lots of even and odd IDs then you probably need to set your fleet map up as a Type I or Hybrid System.
If you want to go in the other direction and convert the Motorola hex value to the Trunktracker value, do this: Convert the hex value to decimal and then multiply the result by 16. Don't add any leading zeroes here. Some examples:

```
Motorola Trunktracker
hex dec mult
-----------------------------
003 = 3 *16 = 48
07D = 125 *16 = 2000
097 = 151 *16 = 2416
AB9 = 2745 *16 = 43920
FFF = 4095 *16 = 65520
```

****
The patent(s) pertaining to TT have not yet issued. Therefore you will find nothing on them from the patent office. The patents listed on the TT box refer to other scanner related stuff. I can tell you for sure that there will be no actual CPU code shown in the TT patent(s).

****

>I am occasionally getting multiple group IDs for the same talkgroups
>on some of the local SMRs. For example, a particular talkgroup on
>Kodak's system will show up as 47703 (most often) or as 47692, 47661,
>47691, 48215, or 48152. All of the IDs correspond to the same group
>of units and sometimes occur during the same conversation.

This means that you have defined a Type II fleet map for a system that is either a Type I or Hybrid (Type I and Type II) system.
Here's an answer I sent to another user regarding the mixing of Type I and Type II IDs in the same system. Perhaps it will answer some questions for others.
It's possible that there are a few Type I radios lurking in your system. If so, one or more of the 8 blocks will be designated as Type I blocks. In this case you have a Hybrid system, and it may be either a mix of Type I and Type II or Type IIi. Type IIi is where the radios transmit a Type II ID to the site controller but the controller looks up the Type II ID in a database and then format and transmits a Type I
OSW reflecting the Fleet-Subfleet affiliation (not Talk Group affiliation, which is associated with Type II radios), of the requesting radio. These radios and their IDs appear as, and are treated as, Type I IDs by the mobile units. It really is only of
academic interest to the user which of these radio Types, (I or IIi) actually generated the channel grant, it's all the same to the BC235.
If there are Type I radios on your system it appears that they are not often used, as the IDs you posted were all Type II IDs. In general, you can identify a Type II system by the predominance of IDs which are integral multiples of 16. A pure Type I system will have an equal mix of both even and odd IDs. (This assumes you have "defined" the system as a Type II system). Even a pure Type II system will occasionally display some none Type II appearing IDs. These can be a number of things: A "patch" where two or more Talk Groups are "connected"
together, an emergency button activation by a radio user, a digital (DVP etc.) encoded talk group, and other stuff I don't know about. If you are seeing a number of Type I IDs interspersed within what you know to be Type II IDs you will want to determine what block(s) the Type I IDs are in. Try this: divide the Type I ID by 8192, discard the fractional part. This will tell you what block the ID is coming from.
Do this for several of the IDs across the range of IDs you are seeing so that you are sure you've got all the Type I blocks. There might be more than one. After you figure out which blocks seem to be Type I, reprogram the fleet map to make these blocks one of the Type I size codes. S3 or S4 are good ones to start with. Make all the other blocks Type II, (S0). Now pay attention to the Type I conversations, and see if you are hearing all the replies, (make sure you have Delay On). If so you're all set. If not, try a different size code and repeat. You think this is a pain? You should have seen the first cut at this fleet map assignment thing. It required you to determine not only the size code, but the starting ID of the Fleet-Subfleet, major aggravation!

Even with what I consider to be the simple current method of setting up the fleet maps, I expect to hear lots of complaints. But there's no way around it. The radio (even Motorola's) must know this information to parse the OSW information.

****

On another note, I keep seeing questions come up regarding whether or not TT needs all the system output freqs. to work correctly. The answer is yes. First of all, it does not matter to TT if you have locked out any or all of the frequencies in a trunking bank. In trunking mode the lock out flag is ignored by the radio. Therefore, claims such as "I locked out everything but the data channel and TT
still worked." are meaningless. If you are missing ANY output frequency actually used by the system you will miss part or all of some conversations. Any talkgroup assignment made to a freq. not in the trunking bank for the system you are listening to will not be seen at all. Such assignments are ignored by the radio. Notwhithstanding the fact that Motorola's radios only need the data channel
frequencies, TT must have ALL the output frequencies.

Phil Fostini wrote:
>
> Does anyone know if there is anything or any product that can produce
> digital PL?

Had a piece of test equipment once that had both CTCSS and DPL decode and encode. It was made by a Canadian Company called Ferritronics. Unit was called "Coded Squelch Test Unit"

Perhaps some of Canadian friends call see if the company is still in business.

Be aware that some radios will not work with encoding DPL. Radio must be a pure FM transmitter. Some Ham units utilize Phase modulation.

E-Mail me if you need any furthur info.

I'm not familiar with that particular radio, but a few things to check:
Is there a battery to keep memory alive if power failes? Is it good?
Is the memory still kept if the radio is *unplugged* as opposed to
turned off? Possibly the new user is using something like a switched
power strip, effectively unplugging the radio.

3637. Is there a problem partially charging NiCads ?

Newsgroup: rec.radio.scanner
Date: 1997-06-05 00:00:00 UTC
From: Bob Brubaker <bob@belvoir.army.mil.NOSPAM>
Message-ID: <01bc71c8$48002c20$957534c0@brubaker.belvoir.army.mil>
Source record: 195432

I know that partial discharge cycles will reduce the Amp-Hr rating on many NiCads, but was wondering about partial charge cycles.

If you have a discharged NiCad and only partially re-charge it, is it detrimental to the long-term life or capacity of the battery ?

Bob Brubaker

> maybe even a software change that can be entered from the keypad....

Restoring cellular in the R10 is a matter of adding two 10K SMD
resistors across two empty pairs of pads, and resetting the radio.

R10's available from us for $525 + UPS. Mod info sent separately from
order to persons purchasing from us.

Rich Wells' page has a very decent review of the radio. Other than
slow scan speed most of it is pretty decent.

3639. ic-u16 2-way radio

Newsgroup: rec.radio.scanner
Date: 1997-06-05 00:00:00 UTC
From: Steve@swssec.com
Message-ID: <3396184c.42828311@news-s01.ny.us.ibm.net>
Source record: 195434

warrior357@aol.com (Warrior357) wrote:

>..and for the ic-u16 what is
>the frequency range on them

U16 was available in 3 frequency ranges covering approx 400-440,
440-480, and 480-512. The most common range is the mid split which
covers amateur fine.

There is substantial overlap between the splits, and you also can move
them quite a bit by intelligent tuning.

Hope this helps ..... Steve

Source record: 195435

Oh Great Scanner Gods, forgive this impertent newbie for asking so simple a question, but...

Has anyone seen the new BCT-10 and BCT-12 scanners from Uniden? I was surfing the net and found them on Uniden's home page

http://www.uniden.com/docs/product/prlist.asp?prodcat=7

and was wondering how good they were, and exactly what they do, for that matter. The ad copy says that they scan for "special secondary frequency transmitters mounted on most highway patrol vehicles in the U.S." Exactly what are they talking about? And do these secondary transmitters transmit continuously? This would be a great addition to my arsenal, especially since radar detectors are illegal in Virginia. I was just curious as to how effective they are.

Thanks in Advance,

Randy Stone

3642. HOW TO: Icom 2SRA Discriminator Tap Mod

Newsgroup: rec.radio.scanner
Date: 1997-06-05 00:00:00 UTC
From: smooth@bu.edu
Message-ID: <5n4vjv$8m3@news.bu.edu>
Source record: 195467

IC2SRA Summary: Discriminator output tap

Modification instructions for the Icom IC 2SRA Handheld

Joe Grand
smooth@bu.edu
May 22, 1997

Abstract

The ICOM 2SRA is a 144MHz FM transciever and wideband (50-905MHz) receiver HT, ideal for mobile communications and ham radio. With the increasing popularity in digital data monitoring, using protocols such as POCSAG, FLEX, and MDT4800 for Mobile Data Terminals, audio signals from the speaker output are not the most reliable. Modification of the radio to get a tap from the discriminator output will let us receive the best quality digital signal, with no audio filtering and amplification (which will "massage" the signal for the best quality within the voice range).

Schematics and system block diagrams are supplied with the Icom 2SRA. By using these, I could find which IC was the FM IF and tap the output signal before it went to the filter circuitry. I added a tiny external SPDT switch to switch the "Speaker Out" jack between standard speaker output and discriminator output. This leads to hardly any external mess and keeps the radio looking nice, with minimal destruction to the internals of the radio. The modification I performed consisted of disassembling the entire radio, desoldering a board, drilling holes in the PC board, and resoldering connections. If done correctly the first time, you will be able to skip a lot of the heartache I had to deal with (which is part of experimentation, of course). The modification can be simplified by not adding an external switch, and just bringing out two wires (discriminator output and ground) to connect to your POCSAG decoder, etc.

Upon examination of the block diagram, I found that the best place to tap the discriminator output was after the Motorola MC3372 Low Power Narrowband FM IF.
This chip can "perform single conversion FM reception and consists of an oscillator, mixer, limiting IF amplifier, quadrature discriminator, active filter, squelch switch, and meter drive circuitry." Pin 9 of this IC is the "recovered audio". This is what you want.

Modification

Disassembly of the radio is a time consuming and delicate process. Be prepared

to spend quite a few hours (if not days) working on this project, as you don't want to screw up a perfectly good (not to mention expensive) radio. The

modification is well worth it, though, and will make your data reception quality magnitudes better.

1. Remove all screws from external casing and pull apart

2. Take out the small PC board at the bottom of the circuit. This UT-63 Tone Squelch Unit comes standard in the U.S. versions of the radio, but is optional for other countries.

3. You will see two metal boxes in the center, these are the transmit (TX) and receive (RX) modules. They are removable to keep the rest of the radio circuit modular and so a technician could easily replace a faulty unit or convert a 2-meter (144MHz) rig into a 440MHz rig. Disconnect both boxes from the connectors (they are screwed together). Take off the screws so you have two separate modules.

4. The MC3372 IC is inside the receiver module (the top one). It is a 16-pin SOIC package. Peel off the gold tape and pop off the cover.

5. If you are going to mount an external switch to switch between standard speaker output and the discriminator output, be prepared. The easiest thing to do would be to solder a piece of wirewrap wire to pin 9 of the MC3372, drill a hole in the case, and pull the wire through. This is simple but messy, unstable, and not recommended.

6. The next steps involve finding the traces on the PC board that go to the "Speaker Out" jack. Using a multimeter, find which pad on the PC board nearest the jacks (Jack PCB) is connected to the tip of the "Speaker Out" jack. The tip is the speaker output, the middle is for microphone input, and the sleeve is ground. Once you've found the pad (it is a fairly large one), mark it with a permanent marker so you don't forget where it is.

7. Look towards the bottom of the PCB, you will see a single row of solder pads. Find which one of these is connected to the pad you just found in step 7. If you look on the schematics, you see that the "Speaker Out" jack is connected to another board via an interconnect, which is connected to the audio filtering circuitry. What we are going to do is cut the trace before it gets to the speaker jack, so we can connect our switch. I believe the pad you want should be the 5th one from the left, but double-check on your own.

8. Once you are SURE that you have the right pad, you need to cut the trace that connects it to the pad in step 7. Unfortunately, this trace is on the UNDERSIDE of the PC board and requires desoldering and even more disassembly of your radio. If you do this right the first time, you won't need to go underneath and can leave the rest of the radio intact. Using a very small drill bit (I used a small hobbyists handheld drill), drill above and below the wire soldered to the pad. This way, you free the wire from connecting to the "Speaker Out" jack. Use an X-Acto knife to make sure no traces are touching each other, and use the multimeter to double-check that the connection has been severed.

9. Now you need to solder the connections to your small SPDT switch. Using wirewrap wire, you need to solder to three points:

o The wire you just drilled around in step 9 connects to the middle terminal of the switch.
o Pin 9 of the MC3372 connects to the left (or right) terminal of the switch.
o The pad from step 7 connects to the right (or left) terminal of the switch.

10. Plug the TX and RX modules back into the radio, connect the AC adapter, and turn the radio on. If everything has gone right, the audio output (both through the internal speaker and the "Speaker Out" jack) will work only with the switch in one position. When you switch to the other position, you should only hear a faint hiss. Discriminator output is unfiltered and unamplified, and the signal is usually 800mV - 1V P-P. Volume adjustments and squelch do not work with the discriminator output.

11. If something isn't working right, go back and check all the connections and cuts you made. My modification did not work at first, and as mentioned above, I had to disassemble the rest of the radio to get to the underside of the Jack PCB. I am not going to go into specifics, since its practically impossible to describe step by step. My problem turned out to be a shorted connection between pins 4 and 5 where I drilled through the pad. Be very careful if you have to take the whole radio apart and make sure you don't lose any parts or stress the flexible interconnect cables, and don't forget how to put it all back together.

12. If your radio behaves as expected, you are at the final stage. I used a small amount of Epoxy to mount the switch to the left side of the radio (the side WITHOUT the "transmit" and "function" buttons).

13. Mark and cut (using a Dremel tool) the other half of the case where necessary - in order for the switch to fit snugly.

14. Double-check that it all works correctly and screw everything back together. Depending on your switch type, you might need to protect the metal contacts with a dab of Epoxy and/or electrical tape to keep them from shorting against the inside of the metal case.

15. Close up the radio and hope for the best!

If you are unsure of anything, feel free to contact smooth@bu.edu. I take no responsibility if you destroy your radio. I am assuming you can read schematics and follow block diagrams. The step by step above is to be used as a guideline, and not taken as gospel. This modification does work, though, and if you do it right you will be very happy.

Adios. -j

Appendix

Motorola MC3372 data sheet:
http://sps.motorola.com/books/dl128/pdf/mc3371rev1g.pdf

Other modifications of this radio include a 138-174Mhz extended receive and transmit mod. This can be found on any radio modification site. You could also try to contact TPDugan@dockmaster.ncsc.mil.

For more information on discriminator modifications, see "Discriminator & Baseband Audio Outputs for Scanners" by Bill Cheek (bcheek@san.rr.com), posted often on rec.radio.scanner.

From: kz440@hotmail.com
Message-ID: <3396011d.31147206@news.nstn.ca>
Source record: 195472

Hello as there are so many scanners on the market it is hard
to pick the best. Here is what I need.
First of all our local police use a trunk system, it appears to have
about 15 channels. I would like a scannre that had at least 200
channels or more, it must have at least 5 banks and 10 would be
prefered. The audio from the speaker must be loud enought to use in
the car. A nice feature would be a dc connection and an connector for
an external antennae. It does not have to operate on ac, if it doesn't
then a dc converter would be required. Any suggestion??
Also any web sites that I might find info on the scanner(s) you
recommend.
Thanks

>
The unfortunate alternative is what we AR8000 owners refer to as
"sputtering squelch". Trust me, the squelch tail is better. On the AR8000,
the RC circuit which times the cutting off of the audio, was cutting it off
to quickly. In order to lengthen the time, I increased the capacitance in
the RC timing circuit (per AOR UK). I suppose that if you want your
squelch to cut out weaker parts of the transmissions along with shortening
the squelch tail, you could decrease the capacitance in the RC timing
circuit.

I don't know what the cops are like where you are, but, they don't do
that here. I'm a firefighter/paramedic and a former city cop and
believe me it just aint so. In 30 years of responding to emergencies I
have met very few cops who do any kind of patient care. In fact police
often delay patient transport to have EMS crews get information for the
police before transport. These delays are solely for the convienance of
the officer so he wont have to drive to the hospital to interview the
patients. I live in a large metro area and I have worked in very rural
systems and I can't remember a police officer ever giving CPR or first
aid to a patient And as for cops keeping someone calm that also would
be nice but it usually wont happen. In fact the few times cops have
gotten involved they hurt patients and interffered with EMS and Fire
personal. Cops typically freak out at the first blood showing and start
screaming for EMTs to just load up that guy and get going!! All in all
I'm certain that there is a place in society for the police. Larry G.

To which you should add;
Never use html format in newsgroup postings.

[.......]

Never use html in newsgroup postings.

If you hang around the newsgroups for any length of time, you're bound
to see that posting using html format results in flames and the
assumption that you are a newbie who doesn't know the differance between
newsgroups and the WWW. Even the stauchest supporters of the hobby get
tired of plowing through html formatting codes which do nothing on a
newsreader. Those of lesser maturity will even assault you with less than
civil verbage.

My advice is to do your homework first. Follow the newsgroup to see
what is going on. See what a mess html makes of your posting and how

rediculous it looks. Get to know what is, and what isn't, the WWW.

:mage freq of actual frq.

What he is trying to say is that you are hearing an image of the actual
cellular frequency. If you subtract twice the first IF frequency of
your scanner and tune there you should here the same conversation.

Unless you have a Motorola Astro series radio, programmed for the system by the system owner, it ain't gonna happen, not even with the TTracker.

Suggest amateur frequencies and aircraft band, maybe even the weather bands, but, FOR NOW, astro digital isn't possible.

Hello,

The Atlanta Ham Fest is coming up in a couple of weeks. I recently bought a BearCat 230XLT (200 channel) scanner right before the race in Talladega. I couldn't wait for the trunk tracker.

I thought about checking out the pre '94 scanners that might be available at the fest, that pick up the cell freqs. Since I'm new to scanners, I'd like some recommendations on models that you think I ought to look at and what you think the going rate is for these.

One specific question is: what is the specific cell freq range that is being nulled out these days?

thanks in advance

Price/value is a personal conception, but FWIW I think it's a good buy. The 2026 is subject to a lot of intermod if you're in a high RF area, but it's hard to beat at under a hundred bucks.

>I suupose you're right Gary, it would save the crack dealers

We're not talking 'crack dealers' here. There are documented cases
pending (do a search on it), of JBT's (jack booted thugs, of course)
abusing and actually murdering innocent law abiding citizens with no
accountability whatsoever. Those who try to bring this to light
(ie Soldier of Fortune magazine), American Spectator, etc... are labeled
as lunatic, right wing, paranoid, fringe crackpots.

These cases typically involve LEO's (federal or local 'elite' units)
pointing automatic weapons at women, old men, and children just jostled
out of bed, forcibly slamming their faces to the ground, (with enough
force to hospitalize them). All under the excuse of 'oh we don't know
what to expect'... prudent jurists have ruled that old ladies in
night gowns or 8 yr old children don't deserve an MP-5 laser sight
on their foreheads or to be brutalized by LEO's executing an incorrect
search warrant.

This law and order crusade bears a resemblance to Hitlers Germany
back in the 1930's.... one day your going to wake up and find a
police state....since all the citizens see nothing wrong with LEO's
(or the 'state' taking away the civil liberties we take for granted
right now)....

Wasn't Churchill criticized for raising warning flags about the
rise of the Nazi's ?

I would like to take this opportunity to publicly thank Jeff Libermann at THE HAM STATION in Evansville, indiana, for gettin a new Trunk Tracker to my door in such an expedient manner, and at a reasonable price.

As many others here have stated and will attest to, Jeff is very easy to deal with, informative and helpful, but most of all, the folks at THE HAM STATION are honest.

I am in the process of learning this exciting new scanner, and will post my thoughts on it at a later time...

Jeff advised me that as of today, 6/6 he has 56 Trunk Trackers in stock and available for shipping.....

Give him a call at 1-800-729-4373 and get yours before Motorola has them all recalled!!! 8)

Realistic Pro-2006A Scanner -- $400 firm

* Seldom used for 1.5 years when bought new
* EXCELLENT condition!
* 400 channels
* Hyperscan
* Triple conversion
* 25-520, 760-1300MHz (see modifications below)

Slightly modified in these ways:
* Restored cellular coverage (clipped diode D-502) - "The Ultimate Scanner," Bill Cheeks, Copyright 1995, page 139.
* Increased SCAN rate by 25% (clipped diode D-503), ibid.
* Removed AC power supply, ibid., page 59

Price also includes:
* Box, owner's manual
* Realistic SERVICE MANUAL (ordered seperately with all schematics...)
* "Scanner Modification Handbook," Bill Cheeks, Vol.1 Copyright 1990, Vol.2 Copyright 1991
* "The Ultimate Scanner," Bill Cheeks, Copyright 1995
* "POLICE CALL + Beyond Police Call," (1997 edition), Vol.6, covering: Washington DC, FA, GA, NC, SC, VA, WV, & Puerto Rico
* 2.5' magnetic mount antenna: 25-1300MHz coverage (Radio Shack)
* Some old scanner magazines (if wanted)

I am selling to help get enough $$$ to replace my old 386 computer.

Inquire through e-mail to:
Scott Heitshusen

I have one and I love it... I only wish you could program an alphanumeric name for all 500 channels. Basically, it covers from 25-1300 Mhz (except for cellular, of course), has 500 channels, and is a lot more sensitive than my Pro-2035. (Which I sold when I bought the 9000).

I would recommend this scanner to anyone.

3674. Re: What is a Trunk Tracker / Trunked System?? @@

Newsgroup: rec.radio.scanner
Date: 1997-06-06 00:00:00 UTC
From: ronkatz@interlog.com
Message-ID: <3397a504.1503422@news.interlog.com>
Source record: 195250

A trunked radio system is a two way radio system with many
different users and/or companies that share a few channels without
hearing other users not associated with them.

Who is using what channel and who can monitor what is all
controlled via computer and information is sent to monitoring radios
that can follow its instructions.

The radio are smart radios and can follow instructions such as what
channel to go to and who to monitor. Who is no longer paying for
service and not permitted to effect others users. Because at any
time a user can be on a different channel depending what's available
and been assigned by the trunking controller its difficult to monitor
and follow conversations unless you also have a radio that will follow
the same instructions.

You can do a few things. You can buy a two-way radio that is
programmed to be on the same system as who you want to monitor or buy
a new scanner that can now decode and follow the same instructions.

Uniden has developed a "trunk tracking scanner" .....and that's
what all the discussion is about.

Hope this helps.

3676. IC-R10 auto tuning step problem

Newsgroup: rec.radio.scanner
Date: 1997-06-06 00:00:00 UTC
From: baptpdc@netcom.com
Message-ID: <33985d5f.70268435@news.flash.net>
Source record: 195252

With the auto tuning step enabled on my R10, it seems to only work on even digits unless I key in an odd freq by hand. This is real weird.

Example:

Auto Mode Edge is set from 88.9 - 107.9 with a tuning step of 200kHz. If i key in 105.1 and turn the dial, it works like expected. (105.3, 105.5, etc)
If i drop from the band above it, however, it drops like this:

108.025 (25khz)
108.000
107.975 (200khz, but only drops to the next EVEN frequency)
107.800
107.600
107.400

It does the same thing coming up from the bottom, also.

Anyone know a way around this?

3677. Federal Monitoring

All,

The FedCom e-mail listserver dedicated to the monitoring federal
(non-military) communications is now open to the public. If you want to
keep track of what the "jack-booted thugs" in your neighborhood are doing
then join FedCom now.
This is a moderated list. Flaming, either of other listmembers or of
federal authorities, will not be allowed.
To join FedCom send an e-mail message to: majordomo@grove.net
Subject: FedCom
Message: Subscribe FedCom
Do not use a signature line. Once subscribed to send messages to the
list send them to FedCom@grove.net.
While FedCom is conducted using the facilities of Grove Enterprises
they are simply nice enough to provide the hardware and have nothing to do
with the list management.

Once again,

Another DOPE enhances our newsgroup with a meaningful post.

#1. Plenty of Radio Shack scanners ARE Uniden products.

#2 The ones that aren't are usually better than most Unidens, as in
the GRE products.

The Pro-60 is a great radio for $199. Not for $379, but for $199 it
toasts anything else available for THAT price. I guess you've never
heard of the Pro-2004/5/6 either?

How many Uniden dealers offer a 30 day money back (No questions asked)
guarantee?

I own plenty of examples of both companies products, and I really don't
think Uniden's own branded products are any better than most Radio Shack
Products.

I would't trade my 2006/OS456 & Pro-2035/OS535 setups for the world.

The list of CB Shops is finally available for your shopping & repair needs
all over the nation.
CB Shops listed from East to West and North to South are available
and
ready to address your needs. Some carry hard to find equipment, and

some carry wholesale parts & equipment.
Whether it's a brand new radio or an old tube type amplifier, your
chances
of finding what you need are much greater and faster with this
brochure.

This brochure is LOADED WITH OVER 50 names, addresses,
and telephone # 's of
different shops, shacks, and even, shops on wheels.

This brochure will pay for itself with the time it will save you
in searching
for that one shop that can accommodate your specific needs.

Here's how to get your copy of this, fast selling ,
brochure.....

Send $2.00 cash, .32cent stamp , and of course, your snail mail
address
to.....
(please include your e-mail address)
TEAMWIN 01
P.O. Box 0583

Tom Hamilton <tomh@eosinc.com> asked:
> What upper and lower limits should I set my PRO-43 at for scanning the
> cell phone band?

From the FAF - Frequently Asked Frequencies
on ftp://oak.oakland.edu
as /pub/hamradio/docs/misc/scanner.faf

Cellular Telephone [22.902]

Chs Freqs (base) System Use

991-1023 869.040 - 870.000 A - RCC voice
1-312 870.030 - 879.360 A - RCC voice
313-333 879.390 - 879.990 A - RCC data
334-354 880.020 - 880.620 B - Telco data
355-666 880.650 - 889.980 B - Telco voice
667-716 890.010 - 891.480 A - RCC voice
717-799 891.510 - 893.970 B - Telco voice

Transmissions are FM (some systems are adding digital).
Channels are 30 kHz apart. Mobiles transmit 45 MHz below the
base (824.040-848.970) and are usually repeated by the base.
Channels 991-1023 are also identified as Chs 800-832.

It depends on what you want to do with the scanner. I have both scanners.

The Pro60 has triple conversion which filters out 'ghost' images better
than the Pro51, does not pick up cellular (Which seems to be a big hobby
with some people) and has FM radio reception capability.

The Pro51 is some what easier to use, will pick up some cellular 'ghost'
images in the 890-910 range and has better battery life.

3694. Re: Can you help ID this item? Antenna splitter??

Newsgroup: rec.radio.scanner
Date: 1997-06-06 00:00:00 UTC
From: "Jonathan A. Mills" <millsja@email.uah.edu>

I recently bought the same device from a local electronics store. Yes it is designed to allow the CB to recieve and transmit over the cars radio antenna. The first time I used the device it worked rather well, or so it seemed. After further attempts, it does "recieve and transmit" but not very well. Best hope is , since it is designed to allow the concealed operation of a CB. buy a CB antenna T splitter, this will plug directly to the back of the the CB. To one T plug in the device (connected of course) to the other side of the T plug in a external antenna such as a magnetic mount. This way you can keep the antenna in your trunk for concealed operation, and then use it whenever you wish. Another good idea is to get a extension wire between the T and the Antenna so the antenna can also be disconnected. When used alone the device in question doesn't work terribly well, however using both the device and another antenna, reception can be greatly improved. The device has the 2 holes to fine tune the freq's for max. performance. Mine came with a plastic screw driver type device to adjust these settings (but of course no instructions) The device seems to work extremely well if everything is attached properly (The CB must be well grounded thus 'hardwired' to the car).
Hope this helps you out and good luck.

Hi there,

I just thought I'd mention that I'm writing an ACARS decoder for the
PC, which I plan to make FREEWARE!

I believe that will make it the first FREE ACARS decoder.

I have around about 4 weeks more develpment left (I'm writing it
in my spare time!)

It will use the line-in socket of a soundcard equipped PC to decode
ACARS in real-time. The algorithm I am developing isn't rocket science
hence requires a sample rate of 22050Hz.

You therefore need a SBPro or SB16 or later...the earlier ones can't
sample this fast (compatibles should work too).

Bye for now,
Khalid.

And so should you. The major gain is due to getting rid of the carrier, which contains 2/3 of the power, giving 4.77 dB effective gain. The 50% (or slightly more depending on the low and high frequency cutoffs) bandwidth reduction is in second place with 3.01 (or a slightly more) dB effective gain.

Which means that for the same average power, SSB will deliver at least 7.78 dB more effective received power, a result both of less wasted energy, and less bandwidth.

Don't forget that DSB (double sideband) was tried first. And it did give the 4.7 dB advantage as promised. And it was a rotten mother to get, and keep, tuned in the days of LC tuning.

> This is also why SSB is inherently more noise immune that AM, but not
> as
> good as FM.

Partly.

> Of the 3 modes, SSB offers the most versatility (ease of
> use, low bandwidth considerations, and weak signal work, etc.).

True.

> Next time you decide to spout nonsense, make sure you *KNOW* what you are
> talking about first....

No comment. Just a thought about glass houses.

Source record: 195288

The Ohio Highway Patrol works on VHF-Low Band. But in the process of
going to a state-wide 800 mhz. trunked system.

Below is the last list that I have:
44.9400 - F-1 District 1: Allen, Putnam, Defiance, Henry, Williams,
Handcock,
45.2600 - F-2 Hardin, Lucas, Fulton, VanWert,
Paulding, and Wood
Counties
District 6: Delaware, Fairfield, Perry,
Franklin, Licking, Madison,
Morrow, Knox, and Picaway
Counties
District 7: Belmont, Monroe, Guernsey, Noble,
Jefferson,
Harrison, Muskingum, Coshocton,
Morgan,
Tuscarawas, Carroll, and
Washington Counties

44.9800 - F-1 District 2: Crawford, Wyandot, Erie, Ottawa, Huron,
Marion,
44.8200 - F-2 Richland, Sandusky, and Seneca
Counties
District 4: Ashtabula, Columbiana, Geauga,
Lake, Mahoning,
Portage, and Trumbull Counties
District 8: Brown, Adams, Butler, Hamilton,
Clermont, Clinton,
Highland, Greene, Fayette, and
Warren Counties

44.7400 - F-1 District 3: Ashland, Lorain (155.445), Medina, Stark,
Summit,
44.8600 - F-2 Wayne, and Holmes Counties
District 5: Auglaize, Mercer, Clark, Champaign,
Miami, Shelby,
Montgomery, Preble, Darke
(154.8600), Union, and
Logan Counties
District 9: Athens, Hocking, Gallia, Meigs,
Jackson, Vinton,
Lawrence, Ross, Scioto, and Pike
Counties
District 10: Cuyahoga County

F-1 is Post to Car
F-2 is Car to Post
45.0200 - F-3 - Intersystem and Aircraft
45.1000 - F-4 - Intersystem, Special Operations, & Aircraft Backup
155.3700 - Police Inner-City Network
154.9350 - Law Enforcement Emergency Network Ch. 1
154.6800 - Law Enforcement Emergency Network Ch. 2
154.4750 - Nationwide Police Mutual Aid Channel
155.4450 - Repeats F-1/F-2 (Lorain County)

I do hope this listing is helpful. I do not know the 800 mhz frequencies or at what stage they are at, installing the system.

Enjoy

I thought 4 Watts was a legal limit. you can use 5 watts ? I should
modify my CB radio then. I don't do this until I check the legal
limit, but I want to do it if it is legal.

>The range on a 5-watt handheld CB depends on the surrounding terrain and on
>the 11-year sunspot cycle.

Usually, 1 watt = 1 mile in AM mode. If you use SSB, it is around 1
watt = 1.5 mile... so 12 watts = 18 miles ?
If the sun activity is high, you will hear somewhere around the
station 2500 km away (AM) due to the propagation. If you use SSB,
you can likely contact someone in anywhere in the world. I live in
the central BC, and I heard California station on June 3. It was AM
mode.

>I'm looking for the best way to record trunked
>radio. Is it possible?

anything is possible....but?

why would you want to record a trunked series
of non-connected verbal outpourings that go
nowhere fast.

does your scanner have a jack in the back?
if so, get a recorder, the cord and see what happens.

Or get a box, a recorder, a scanner and put these in the box
so ambient sound would be recorded and later on play-back.

or the TT...no connection for a scanner/recorder hook-up.
I guess you'd have to use the box.

Or are you talking legal reasons>...who is going to tell
on you?

could you be more specific as to what you have in mind?

too general a question and i don't know what size box
you will have to get into with your equipment...

No. the people are just looking for someone to blame on.
I became one of the targets.
I already told the people to look up Industry Canada's call sign
database if they were really in doubt. It makes clear that I am a
legal amateur. However, they just don't listen.
They keep blaming me on the newsgroups, especially in the scanner
newsgroups. (I am following up to amateur newsgroups since I posted
the original into the amateur newsgroups)
I have no idea why you have to have a license (I do though) to post
the articles into the newsgroups.
I will ignore the posts so they won't have fun (?) from blaming me.
I am sure they will look for someone else. Watch out... "you" may be
the next one.

I was flamed about this follow-up.

I stated this in general. I know the power fades out with (1/x)^2
equation...
But... 1 watt = 1 mile is practical for CBs. I just wanted to tell
him how long he can "usually" reach. You can't reach someone with
0.00005W of power 5000Km away. It's a logical sense.

>If the sun activity is high, you will hear somewhere around the

Here, I stated SSB is better since you can use more larger output
legally.

I was under the impression that in order to get the FCC to approve the radios, they had to have some sort of a 38-dB cellular attenuator, so that no cell images could be monitored. I don't believe a cellular restoration mod is possible, but that is my opinion and I am in no way even close to an expert on it.....

IMHO, FWIW, YMMV, etc, etc....

I agree. Aren't you glad we have the FBI, ATF and others to stop criminals from treating innocent people like this?

(And if you're suggesting that certain law enforcement officers act like this then I must assume you have personal experience and have seen such actions with your own eyes or you otherwise wouldn't make such a suggestion.)

Mailloop v3.0 is an industrial strength bulk mailer.

Mailloop v3.0 is a bulk mailing program for the internet. It can take a single message and broadcast it to either a listing of e-mail addresses or to a listing of newsgroups. Creates custom newsgroup lists by filtering NNTP servers. Creates custom e-mail lists by extracting them from newsgroups. Can also extract e-mail addresses or newsgroup names from other protocols. Built-in NNTP, SMTP, POP, FTP, HTTP, EXEC, CGI, WHOIS and FINGER clients. Anti-cancelbot feature. Automatically processes remove requests. Includes extensive on-line help.
The most powerful bulk mailer available. Requires Windows 95 or NT 3.51+ and internet access.

The "Program" Mailloop is only available in English.

For more info goto: http://205.199.4.219

http://205.199.4.219

Using it is easy:

1) Create a message (http://205.199.4.219/editor.htm)
...by using the pull down menus or
...by using any editor

2) Create a newsgroups list (http://205.199.4.219/news3.htm)
...by filtering an NNTP server or
...by importing from any text file or
...by manually creating with any editor or
...by extracting from any FTP file or
...by extracting from any HTTP file

3) Create an e-mail list (http://205.199.4.219/em3.htm)
...by extracting from newsgroups or
...by importing from any text file or
...by manually creating with any editor or
...by extracting from a WHOIS response or
...by extracting from a fingering response or
...by extracting from a UNIX response or
...by extracting from any FTP file or
...by extracting from any HTTP file or

4) Broadcast the message
...to the e-mail list or (http://205.199.4.219/embc.htm)
...to the newsgroup list (http://205.199.4.219/ngbc.htm)

5) Then process the remove requests
...by using the mailbox processor (http://205.199.4.219/pop.htm)

6) If you want you can use the Newsletter Sever
...The Newsletter Sever will allow you to have an topic-specific newsletter that other can subscribe
and unsubscribe to.
...Customizing this server response files (http://205.199.4.219/response.htm)
...Creating a new newsletter (http://205.199.4.219/create.htm)
...Creating and Updating a newsletter the actual newsletter (http://205.199.4.219/update.htm)

3732. TV Audio Broadcast Freq ?

Newsgroup: rec.radio.scanner
Date: 1997-06-06 00:00:00 UTC
From: Bob Brubaker <bob@belvoir.army.mil.NOSPAM>
Message-ID: <01bc726c$ced60c20$957534c0@brubaker.belvoir.army.mil>
Source record: 195315

When I got my RS Pro-60 I didn't place much value on it's TV coverage.
But it's slowly starting to dawn on me that this could be a neat feature
especially as a way to listen to a TV talk show in the car

Anyone know a Web Site that list the exact frequency's for the Audio
portion of the TV Broadcast Channels.

I seem to remember that they're near the top last MHz of the 6 MHz channel
but that's about as much as I remember.

3733. Re: PRO 43 Mod + serial I/D?

Um.... This really has nothing to do with the serial ID post, but it's PRO-43 material. I called up Tandy National Parts yesterday and ordered a bunch of parts to soup up my 43. The eeproms are now running $24 each!!! I was going to go overboard and put 1000 channels in my PRO-43 until I found out that the memory alone would cost $200!!! I guess I'll just do the extra 200 channel mod for now.

They want $17 for the 500 milliwatt speaker!!!! Screw that!!! I'll plug in an external speaker! I've been eyeing up the speakers from cell phones for projects, (most are 1 Watt and VERY thin) but they still aren't small enough to fit in the scanner.

I'm also going to rip out that worthless light behind the display and replace it with a good one salvaged from a cell phone. They seem to be a good source of cheap parts.

I've been trying to figure out how to light up the keypad with the cell phone type lights, but the keypads on cell phones are all light colored and can pass the light. The dark keys on the 43 are too dark to pass anything.

Oh well, I have to fire up the soldering iron.....

I suupose you're right Gary, it would save the crack dealers a lot of
worries if the law enforcement community would arrive about noon, leave
their gones in their vehicles, and politely ask if they can search the
premises. This way, the drug dealers could get a decent nights sleep, and
would be much more alert. This, of course would be important, so they
would be able to gun down the unarmed police.
Better yet, we could just make your neighborhood a non-enforcement area,
and the rest of us would live in peace, since your neighborhood would be
overrun with criminals.

In regards to the 800 MHZ system for OSP, they as of last word have not selected a provider for the system... supposedly they will do this and begin system construction by the end of the year. They then project to be fully operational within three years.

No, I don't feel cheated at all. This statement is typical of your
poor grasp of English and grammar.
>well... you have to learn better English too... to know the actual
>fact. got it ? No frame wars desired.

I speak, read, and write English quite adequately, so this statement
makes no sense either. By the way, it's FLAME not FRAME. Do you begin
to see your problem with the language? Turn off your computer, go out
and take a study course in English and grammar. After you (hopefully)
learn to write English well enough to be understood, THINK before you
post any more of the stupid and silly nonsense with which you have
been wasting so much bandwidth.

F O R S A L E

MOTOROLA MTX9000 fm handi-talkie radio,
model H01WCF4DB5AN NX type WCMA.
900mHz range. With charger and info.
Only $699.

PCMCIA Sound Card --- by AMP. Includes software,
cables, microphone.
V-Synth wavetable synthesizer
Wave SE sound editor
Stratos MIDI software
MIDI Tune-Up
Windows Sound System software
Cardsoft Card and Socket Services
Traveler adapter module
Microphone
Compliant with PCMCIA Release 2.1
12-bit recording and playback☐
5 sampling rates
Turtle Beach Hurricane architecture
Thin-profile Type II card
requires:
Type II or III PCMCIA socket
386, 486, or Pentium processor
4MB of Ram
$65 + shipping..

------------------- F L A S H L I G H T S ---------------------

4-D cell (2x2 style), krypton bulb. In box, never used.
$5 + shipping.

6-D cell multifunction lantern. Sleek tubular style with
bright incandescent light at end, 6W fluorescent bulb
along bottom, and flashing red and yellow on top. Also
has electronic sonic alarm that can be switched on with
the flashing lights. In box, never used. $12 + shipping

3-C cell Eveready worklight-style. Bright yellow with
hook for hanging, frosted bulb to diffuse light over area.
Unused, but no box. $5 + shipping

Batteries NOT included.....

COCA-COLA caps. Red cloth, white lettering. New.
$8 each + shipping. Only 9 available.

..... FOR YOUR DRIVING PLEASURE .....
1929 Mercedes SSK kitcar on VW chassis. Just completed, never titled.
Yellow, with brown fenders and running board, tan convertible top, side
curtains, and tonneau cover. Gold trim instruments.

COBRA 18-ULTRA CB ---- 40 channel, pushbutton tuning, with 3
NOAA weather channels. Includes microphone, but no mounting
hardware. $ 39.

LEXMARK/IBM PORTABLE PRINTER 5183 ---- powered by rechargable
battery or AC wall adaptor (included), this printer is only
11.5" x 3.5" x 2", and weighs about 2.5 pounds with battery
in place. Using silent thermal print head, it will print on
either thermal fax paper or on regular paper using the enclosed
thermal transfer ribbons. Very quiet in operation, and because
it runs on a battery, it is completely portable, for use with
laptop computers anywhere. Includes parallel port cable. $89.
.
ANADEX WORD-SCRIBE PRINTER ---- heavy duty dot matrix printer.
Multiple ports, but no literature so only parallel port in use
now. Tractor or friction feed. Fast, good quality; 17-inch
platten. $ 15
.
add shipping to all prices.
if interested, leave e-mail...

Uh, wake up Otto, reality check. Do you know who makes many of RS's scanners? Didn't think so or you wouldn't have made such a silly statement.

The Pro60 is a far better scanner than the Pro-51 hands down. The 51 which I believe Uniden makes is a dual conversion scanner that really will suck in a high RF environment. The 60 is a triple conversion and has very few image problems.

Source record: 195336

I'm looking for advice concerning how to scan police transmissions on the new Motorola Astro 31-channel digital system recently installed in Memphis. I reviewed articles and FAQ's on various WWW, usenet and compuserve sites but didn't find too much concerning digital systems. I'm not sure whether the Memphis system is being scrambled or encoded. If you can help me get started I would appreciate hearing from you.

Sigh... Lost my BC300XLT at the Indy 500 (say, anyone in here find it?)

So I figure I'll buy a new scanner. Can someone familiar with the 300 compare it with the ICOM R10 and AOR 8000? I have read the company hype and specs, but wonder about the ease of use (or the converse!). Some comments here in the past suggest that the 8000 is a bit of a pain to use. Can someone be more specific?

I like the range scanning feature of the 3000 and the fact I can switch direction of scans. The WX preset is also handy. It's a big help when I try to program a duplicate frequency and it tells me which channel already contains it.

I have a pair of stereo headphones and also a single-ended earplug, so the dual jack setup is a good idea.

The cost difference is not (much) of a deciding factor for me.

So, which one would YOU buy?

thanx,

don

>dish to receive the data/voice. So, can anybody shed anymore light on the
>subject?

Yes I have heard INMARSAT using a MAR-6 homebrew preamp and an ICOM
R-7000 and a 4.5 foot dish. I can't remember where I heard the signals
at I think mear 1550 Mhz....I can't remember I did it for a school
project and knew where to tune then. After calculating the downlink
path loss using the published EIRP and using the expected sensitivity
of my ICOM at that frequency...(someone tested his R-7000 at work for
me on 1550 or 1570 I can't remember)...I expected to be close...so the
MAR-6 added just enough to make INMARSAT heard.

Anyway it was real cold out when I did this...The dish was hanging
from my garage door facing East/South East and propped up (warped) on
a 5 gallon bucket (whats the loss in dB for that?) So I didn't listen
long. This was Winter 1995.

When someone has to pick at minute details of someone elses work it is referred to as pedantry. It is the sign of a small mind. You will not often see someone correct the grammar, spelling, or details of a truly meritless posting. This is because it doesn't thrill the pedant to think he is better than someone who is merely mediocre.

For what it is worth, the original question was answered sufficiently. If someone really wanted more they would have researched it in a library.

Lets not try to destroy people who are only trying to help.

I've been sperated from radio theory for some decades now. Such questions and responses are helpful in jogging my memory, and maybe I'll recover some of the theory.

My recollection is that detection of an AM signal only uses one sideband. So, from a power consideration, why spend the power to transmit bandwidth that doesn't contribute to the eventual audio signal received? The carrier reference can be added back at the receiving station.

However, my recollection might be out of wack, and I'd be happy to be straightened out.

Is FM really better at noise rejection? I always thought that since ssb
had such a smallll and tight frq. that it would be better than the
wideee frq of fm.. ? Not trying to blow any gaskets here, just would
really like to understand better..

The way I always though it worked was as follows:

AM is transmitted at X frq. Sidebands are generated each containing the
same information.

SSB is one of the "Side bands" without the carrier, thus more compressed
information without a carrier.. re-create the carrier to tune it in at
the receive end and viola, more range and less noise..

slap me if I am wrong.

George

Justin, I used to be proud of the fact that the good old U.S.A. was one of the few countries that had no restrictions on radio monitoring. Unlike most other countries we had no restrictions at all. Man, I thought that really said something about the American way of life, freedom and all that shit. Now look at what is happening. I am some what ashamed that we, as a free nation would pass such silly laws.

: But the smaller towns and/or counties (primarily country farming
: communities) simply won't be able to convince their
: citizens that this is an absolute necessity, and most likely their
: tax base won't suport such an upgraded system it anyway.

Well, Corvallis is not exactly a small town - just a small city. They
also share their radio system with the county.

What do they have for communications? About 4 channels of conventional
radio. The company I work for has a better system (trunking). The city
and county does have one advantage - they can scramble some channels if
desired.

: What I also see as a problem, mostly personal, is that
: once Atlanta does go digital, monitoring them will then
: become impossible. Due to the very nature of digitial
: comminications, scanners that would be able to listen
: would only be affordable by the National Security
: Agency!

Keep in mind that digital commmunications, by themselves, are no harder
to receive than analog - it just takes different circuitry. What DOES
become difficult to monitor are scrambled comms - both analog and digital.

I don't know where you're getting your information
about my little, po-dunk city/county, but it's not
correct. I've been listening to them now for a week.

One of two things is true here. Either they are not
digital or I purchased a Uniden Trunk Tracker
radio that has digital capabilities.

What you didn't know is that Greg Whitaker is the director
of our 911 center is a friend of mine of several years
running. Neither the Dougasville police department or
the 911 center here has been digitized in any way unless
the Douglasville uses graphics on their personal computers!

I see from your call sign you hang your hat here in
the south somewhere. why not give me a call and
I'd be happy to discuss who in the metro Atlanta
area DOES use DVP (actually it's the Georgia
Bureau of Investigation). My home phone is in the book -
I'm not hard to find. I'm still working hard to
determine if Metro Fugative Squad for Atlanta
does as well. I don't think so at this point in time.

The frequencies for Metro-Futative Squad are:

151.2050 Metro-Fugative (Channel-A)
156.2250 Metro-Fugative (Channel-M/Output)
158.9850 Metro-Fugative (Channel-M/Input)

They also have been known to use :

154.9050 Intra-County
154.9350 Sheriff's Inter-City
155.3700 Statewide Inter-City
155.4750 Nation-Wide Police Emergency

but not very often. If you're looking for a real good time with
your scanner and you're within rock-throwing distance of metro Atlanta,
plug in the Metro-Fugative guys. They're a real hoot to listen to
playing a little 'James Bond' trying to pick up the bad guys.

I've not heard them on the Georgia 800-trunked system so don't
believe they have the capability (yet), but may soon. That's only
a guess on my part, not to be taken as actual fact.

Roger Cravens
KE4YQZ

I hope you're not planning to hold your breath, Otto. No
manufacturer of scanner in the United States will be building
one for US consumption, and Congress isn't about to change their
minds on this law. Too much money flowing their way from the cell
companies. This also includes the feds who use the hell out of the cell
frequencies and local police departments who use a LOT of cell phone
time to both chat and make sure us scanner listeners aren't listening to
them. I talked to one sheriff here in Georgia in one of the northern
counties and his opinion was we can't use 'cell capable' scanners
forever, but once you get a law on the federal books it takes on a life
of its own and will never go away. Guess he has a point there. This
rediculous anti-cell law will most likely live on forever.

Roger

Hmm...
We are talking about the same county west of Atlanta?
I know digital speech when I hear it and they were using
it last Tuesday on 156.165. they also have a trunking
system that uses digital messaging. I guess I will have
to break down and call you. What repeator do you hang out
on?

Greg isn't holding out on you is he? ;>)

Interesting, you may be interested in knowing that they
setup for a serious raid a few years ago in Cobb County.
I was working at home and heard the action on a vhf
frequency in a scanner was sitting on my desk. The bad
guys were not there. They regrouped in a nearby Amoco
station. I jumped in the car and went over there and
quickly spotted the 'unmarked' cars. I got a couple of
the men aside and told them I was aware of the failed
raid and suggested that they look into more secure
communications if they wanted to stage such raids safely.
This shocked them somewhat and they quickly checked me
out. They said at first with much machoness the bad guys
were too dumb to monitor their actions. Then they admited
that GA was too cheap to buy a better radio system. I
suggested that they use cellphone in a critical situation
as that tended to be more secure. They agreeded and
indicated that they often did just that showing me some
more equipment.

They are not a high priority for me to monitor and I
never noticed that they had bought DES.

I have received numerous complains regarding to my call sign.
I thought it would be a very good idea to ignore a mass
correspondences regarding to the call sign. However, I decided not
to. I wanted to ignore the people whom forced the false statement,
but I decided to clear the problem as the problem is getting bigger
and bigger.

As I posted, my call sign is "VE7JPN." You may wonder why I have a
such coincidential call sign as I came from Japan.
This is how it works:

VE7 = British Columbia

***(last two or three letters) = you have a choice to chose. Some
people chose "CW, SSB, CAN, BC, VAN.......... " It is completely legal
to choose any call signs that you wish. If you want to choose "SEX,
MAN (and whatelse....) " it is legal too. I choose "JPN"
because I couldn't think any of other letters that would fit me.

Go to:
http://www.aras-sara.ca/arasbook.htm (This is a official Canadian
Call Sign Database from Industry Canada. You will NOT find my call
sign on QRZ database. I am an amateur for only three months. Please
do NOT assume I am not a legal because you do not see my call sign on
US database (I received a number of complains because they did not see
my call sign on US database) , QRZ CD-ROM or any other materials that
show the call signs. Go DIRECTLY to Industry Cabada's Database.)

Look Up:
VE7JPN

You will find the information of me.

If you prefer not to know the fact, that's fine for me. But please
stop blaming me that I am not a legal amateur. I am getting sick of
handling 100s of letters to answer why and how I am a legal amateur.
I hope I can reduce a number of the complains and the letters, but I
am sure there are still people who want to blame on me. If you do,
do it to me privately. Please do not take it to public.
I do not want to handle mass complains anymore.

I know I am stupid, and that's fine. You tell me my English is
fu**ing and s***. I accept it.

I know you are smart who believe that I am not a legal amateur.
You are superior over me. You are amazing me.

But..... I do not think I have to be removed by some kind of
forces that support false statements.

Thank you for your consideration.

If you prefer not to know the fact, that's fine for me. But please
stop blaming me that I am not a legal amateur. I am getting sick of

handling 100s of letters to answer why and how I am a legal amateur.
I hope I can reduce a number of the complains and the letters, but I
am sure there are still people who want to blame on me. If you do,
do it to me privately. Please do not take it to public.
I do not want to handle mass complains anymore.

I know I am stupid, and that's fine. You tell me my English is
fu**ing and s***. I accept it.

I know you are smart who believe that I am not a legal amateur.
You are superior over me. You are amazing me.

But..... I do not think I have to be removed by some kind of
forces that support false statements.

Thank you for your consideration.

:thing in a police officer.

I am no police officer. I lack the stamina for such a job and I would
not be tolerant enough of the idiots the police must deal with.

However, it is quite obvious that many Americans are violent and need
no valid excuse to go completly out of control. Someone decides that
a jury is racist so people go out of control and destroy shops and cars
belonging to anyone. They don't care who does what as long as they have
their crowd mentality. Without some control things would be even worse
for you than they are.

Can anyone tell me if the scanner has to be set in a certian way for the computer to start working with it. I just got the scanner and can not get it to work. I have the 2006 and 456 board with scanner wear softwear and can not get the scanner to start to work with the computer. Is there any special settings I need to do. Any help will be useful.The soft wear tells me it to check the scanner settings and port, It seams to be hooked up right. any settings I need to change in setup? PLAESE help
Thanks Tommis

While searching for new frequencies, my 890 stopped on
450.212. It sounded like a party or a large gathering
of some sort. A guy gave a speech latter on, and I realized it
was a street festival called Sunfeast that was happening downtown.
My question is why would it be on 450.212???

3799. Q : NWO changing frequencies ???

Newsgroup: rec.radio.scanner
Date: 1997-06-07 00:00:00 UTC
From: John & Dawn <spam--jerelyea@defnet.com>
Message-ID: <33996D6F.1C69@defnet.com>
Source record: 195129
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Our local police are changing radios,the new ones have a EOT (endof transmission) beep. and the are beening told to switch to Channel 22 as opposed to channel 1 (155.580 mhz).

Anybody know what freq. Channel 22 is or will be. I have several scanners set to search different bands but i can't track them down.

800 mhz is a good guess but i don't think it would be a trunked system for the city as we are not that big

I understand that the Ohio state patrol is switching to 800mhz Trunked with-in the next two years.

When you say an interface, do you mean a Schmitt Trigger circuit?
oh, is 741 op-amp good enough? I think is ok for 2400 baud rate.

3801. Good 800 Mhz Antenna for Trunk Tracker?

Newsgroup: rec.radio.scanner
Date: 1997-06-07 00:00:00 UTC
From: kb2kmm@li.net
Message-ID: <5nbrt4$puc@linet06.li.net>
Source record: 195131

Anyone know where I can purchase a good high-gain, 800 Mhz, ducky antenna with a bnc connector ? I'm in a poor reception area of my local trunked system & need a better portable antenna for my bc235. I have used a Diamond RH77B with good results, but it is 15 inches long. Need something closer to the length of the stock antenna for the 851-870 Mhz range. Thanks.

No WWW site but here is a list I made several years ago. I typed a "BASIC" program to cacluate the freqs and spit out a nice chart..
Then I commented it for shared use channels like CATV overlap of ham bands etc.
Importing here messed up the TABS so you will have to "play" with it a little before printing.

Format is CH# Video freq colorburst freq audio freq
Also for "CATV" the letter of the channel is before the CH#

CABLE CHANNEL CHART 2-13 OFF AIR, 14-94 CABLE AND 14-83 OFF AIR

3803. Maha NiMH Batteries question...

Newsgroup: rec.radio.scanner
Date: 1997-06-07 00:00:00 UTC
From: Bryan <ks4hr@injersey.com>
Message-ID: <01bc7348$4a3d4460$103b8bce@bryan>
Source record: 195133

I just found this company page surfing for "NiMH" the other day.
They make "packs" for most Amateur HTs and was wondering if anybody has
used their battreies?
They sell loose AA size 1200 mAHr cells for 3 bucks each.

I just bought one of the PRO-60s on sale and with it's 100 mA draw these
look like the battery you could get all day of use out of.

Anybody have experiance with this company or will I be the test case??

The company is:

Maha Communications, Inc.
http://www.maha-comm.com

Tel: 1-800-376-9992

Thanks for any replys! (please CC the NG and my email address)
Bryan ks4hr@injersey.com

3804. Re: Party at 450Mhz?

What you heard was a remote studio link to a radio station. The
frequency is 450.2125.
Search between 450 and 451 for other radio stations using these links.

For Sale:

1) Bearcat "Sportcat" SC150 handheld. With 800 mHz. Great condition (just had it checked @ Uniden). With power supply. $85 + s&h.

2) Bearcat 560XLT mobile/base. Scans & recieves, but not getting any audio output. Otherwise in good condition. With both base & mobile power supply. $25 + s&h.

e-mail replies, please.
David

I love the way my Scout works I use the reaction tune with my AR 8000
and I can pick up cell calls from close by autos. Also you will love
the way the Scout stores frequencies there is no need to write hits
down it will be automaticly stored. The Scout is well worth the money
cheapest place to buy one is directly from optoelectronics they have a
home page.

>It isn't possible in your lifetime..

It is possible, but of course it isnt a clip-a-diode type of method.

1)First you can get a UK/AUS CPU and replace the original one. I would suggest actually getting the CPU for the 2042. It will work in the 2035 and in addition to the added freqs, you will also get the added firmware that the 2042's CPU has to offer. NOT FOR THE NOVICE though, the CPU is a 100 pin surface mount...very tiny pins to solder. The only thing good about it is that you dont have to solder 4 of the pins. Gonna cost you about $60 plus s/h from Javiation.

2)You can replace the whole LOGIC board...it comes with the UK/AUS CPU already soldered on it. You will not need to solder at all with this method. Get the LOGIC board for the 2042 for replacement in the 2035 for improved firmware once again. Javiation sometimes gets these in stock, will run you about $160 plus s/h.

3)See about getting an older OS535 board that is able to be code enabled to open up the cell freqs. Only is possible while you are scanning under computer control though! If you have a cell enabled CPU for either a 2035 or 2042 and a blocked OS535, you CANNOT scan the cell freqs under computer control. When the OS535 is activated, it uses its own CPU and disables the scanners CPU and memory.

4)If you are FCC Approved or are using the OS535 as test equipment as a telecommunications technichian then you can pick up an unblocked OS535. Again, opening up the extra freqs is only possible while you are scanning under computer control.

Well, all of these methods do get you from point A to B, there are some cost involved, but in each case there are more benefits than just the extra freqs.

3810. Trunk Tranker - Is it real? Does It Work?

Newsgroup: rec.radio.scanner
Date: 1997-06-07 00:00:00 UTC
From: "Kenrick E. Cleveland" <Kenrick@4everfree.com>
Message-ID: <Kenrick-0706972028010001@cust23.max4.seattle.aa.net>
Source record: 195140

Hello,

I've seen several posts for and against the Trank Tracker. Does anyone have any experience with it?

Does it really work? Is it efficient? Is it worth having or will it become obsolete immediately?

Thanks for any help or info you can give.

Kenrick

3811. FRS in Canada?

Newsgroup: rec.radio.scanner
Date: 1997-06-07 00:00:00 UTC
From: tcoles@tor.hookup.net
Message-ID: <5ncoai$hu0$1@loki.tor.hookup.net>
Source record: 195141
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I was just wondering if FRS radios are available in Canada? I haven't seen any at RS (I should probably try a real radio store though). I have not heard anything on the GMRS and FRS frequencies.

Thanks.

Todd

3812. WinTone 2.0 - DTMF, CTCSS, CCIR decoder and scanner monitor!

Newsgroup: rec.radio.scanner
Date: 1997-06-07 00:00:00 UTC
From: Richard Smerker <rsmerker@steaksandwich.com>
Message-ID: <339A4023.1AF@steaksandwich.com>
Source record: 195142
Cross-posted to: rec.radio.scanner,alt.radio.scanner,rec.radio.amateur.misc,rec.radio.amateur

```
WinTone 2.0 - Tone Decoder/Scanner monitor for Windows 95/NT.
-------------------------------------------------------------

Now available! Decode virtually any tones by using your sound
card and scanner! Here are just a few of the features :

* CTCSS and other Tone Squelch Support

* DTMF, CCIR, ZVEI, EEA, EIA, NATEL and more! It can detect almost
anything!

* Scanner Monitoring - Wintone will record sound to a WAV file for
listening at a later date. It ONLY records when the transmission
is active, meaning you get only the good stuff!

* Plug-In DLL Support for multiple tone formats. And if you want to be
able to detect a new standard or set of tones - We can simply
make a new DLL, and you are ready to go.

* FASTER! Using all the same settings for sample rates as 1.51
(11,025) the program is twice as fast (much less of a CPU Hog).
If you drop to 8000 Samples/Sec, it gets even better!

* Macros - You can now define substitution macros for the detected
tones.
For example, you can define 12345 as "Police Car #1" and 67890 as
"Police
car #2" and if a session detects "1234567890" it will be converted to
(Police car #1) (Police Car #2). Great for CCIR and ZVEI - And even
DTMF if you happen to be using DTMF Paging.

* Triggers - You can assign events to detected tones, allowing you to
respond to tones by Launching programs, recording sound, etc.

This is just the tip of teh iceburg. If you are familiar with the 1.5x
series of Wintone, you will be love the improvements!

Check out our website at : http://www.steaksandwich.com for mor info!

During the LA riots the police ran. And those with scanners knew first,
that they had no protection.

Only the gun owning Korean grocerers were not harmed.

..whichever one you do settle on make sure it is "year 2000 compliant" otherwise it will die (lockup forever) in September 1999 when the date buffer overloads. Newer GPS units have been "fixed" by the manufacturers of the chips, that is probably why the current ones are all being sold so cheaply now, Best to get rid of 'em now before the word gets out in 1999 when they'll be useless.....

I have elderly friend thats having problems with his bc350a. I'll program the scanner for him and in a day or two he'll get "memo loss" and everthing programed is gone.
He had the scanner replaced (walmart) last week...and the new 350a is now doing the same thing.
My question is... does the 350a have a enternal battery to hold the stored frequencies....and could this be the problem?

Pat

Most of the antenna companies offer BNC mounted 800Mhz flex antennas.
Centurion, Larsen, etc. Try 800 information for their numbers, or try a
local two-way shop.

450-451 AND 455-456 are broadcast station two-ways and remote pick-ups.
[455-456 being the input frequency if a repeater is used]

Depending upon the station license and their equipment, you can catch
both narrowband AND wideband remotes in this range. [Narrow band is
the usual heard here, but I have heard one or two hifi widebands in
this range.]

Sir, if you don't care to hear the waves of Frank Burns and Howard Lance Kingston, then don't bother accessing the page which features those waves: <http://members.aol.com/RazzU/QuietOne.html>! It's that simple--if you don't like what you hear on your scanner, you have the option of changing frequencies or turning the radio off--the same logic applies in the case of accessing Web pages.
Freedom of choice is such a wonderful thing!

Obviously, some members of rec.radio.cb and rec.radio.scanner DO want to hear waves of Phoenix's very own Frank E. Burns and Howard Lance Kingston, because since the address <http://members.aol.com/RazzU/QuietOne.html> was published in these two newsgroups 48 hours ago, this page has had at least a dozen visitors, so someone out there is listening. Happy Web Surfing!

Butch, English is a second language to some people. If you want to talk
to Masa, why don't you post all your messages in Japanese ? Then you
won't have to worry about his English, I'm sure he'll reply in Japanese.

>To send mail
>delete the xyz
>from my address.

If you want me to send you email, delete the xyz from your return address
in the software you are posting with. All these programmers did all this work
so we can click things with a mouse, and you think you're important enuff so
everybody is going to manually fix your email address to send you email.
Rite.

Duh, you can't figure it out. Maybe it has something to do with the fact that
QRZ doesn't get info on foreign (non U.S) calls every nite from the FCC ?

>activity on the Ham bands and blow it completely out of proportion. I
>guarantee you there is a bad apple or two in every barrel, but the Ham
>bands I know (10-75 meters) are not a problem.

75 meters is "not a problem?" I don't suppose you've ever heard Big Al's 8,000 watt "jam sessions" on 3894.5, huh? And you've never run across "The Walter Barstool Show" on 3853? Certainly, you've never experienced the constant jamming, malicious interference, profanity, personal threats, music, and other assorted chaos on these frequencies plus 3901, 3950, 3898, etc. Sounds like more than "a bad apple or two" to me. Let's see...there's the above-mentioned players plus "Dumba** Donnie", "Dipsh*t Dan", "Ralph the Thief", "Pork Butt", etc. And guess what? These guys are all Generals or higher. Many of them Extra Class. The Elite of Amateur Radio for all the world to hear!

Hold down 2 9 and Manual or 2 9 Scan while powering up the unit. One will dump all freqs and set them to zero, the other loads a batch of test freqs I guess they use in the factory to tune the unit.

3840. BLIMP FILE- UpdateJune 1997

Newsgroup: rec.radio.scanner
Date: 1997-06-07 00:00:00 UTC
From: rickey456@aol.com
Message-ID: <19970607194500.PAA09133@ladder02.news.aol.com>
Source record: 195207

BLIMP FILE
Update: June 1997

It's time for another update of the BLIMP file. Last report was February 1997 and since that time I've received new information from a number of monitors who have kindly shared their data with me.

I do most of my blimp watching while on a beach either here in New Jersey during the summer months, or in Pompano Beach FL while visiting my Mom. Since one airship is stationed right in Pompano, there is almost year round activity in that area. While there, I always monitor the Goodyear blimp and watch for its activity.

These are the frequencies I've recorded [again as of February 1997]:

151.6250 Airship 3-Alpha to Office
125.4000 Pompano Tower
250.8000 Airship 3-Alpha to Pompano Tower
[Pompano Tower was not heard responding here]

The following additional frequencies have been heard and/or posted over the years:

123.0250 GY Blimp to Ground [NY]
123.0500 GY Blimp to Landing Area [NY] [port frequency]
123.0500 Fuji Blimp
123.0750 GY Blimp to Landing Area [NY]
123.2500 Blimp to landing area [JFK-NY]
Suffield (OH) Wingfoot Lake Facility
Fiji + GY Blimp
125.2500 JFK to Blimp
132.0000 Goodyear Tire & Rubber Company channel
[NYC] N-1-A KCA-186 [1-ALPHA]
GYB used to cover racing
145.5500 2 meter used from Blimps
151.6125 GYB used to cover racing
151.6250 Blimp Operations NBFM
GY to Ground Crew [NYC & Pompano Beach]
151.6400 GYB used to cover racing
151.6725 GYB used to cover racing
151.6850 reported GY Blimp to Office
158.4600 GY
217.4500 GY
250.8000 GY Blimp to Pompano Beach Tower and another airship in Florida
461.8000 GY

462.2250 GY
462.2750 GY
462.4250 GY
463.0375 Metlife Blimp
463.7125 Metlife Blimp
464.0500 WIK-777
464.5500 Simplex DPL-172 GULF (Oil Corp)
Pilots have British Accents.

464.5500 Gulf Blimp
465.8875 Metlife Blimp
465.9125 Blimp Operations NBFM - Low Power
465.9125 GY
465.9375 Blimp Operations NBFM - Low Power
465.9375 GY
465.9625 Blimp Operations NBFM - Low Power
465.9625 GY
466.0375 Metlife Blimp

There was a question about the use of 217.450 and 250.800 by civilian entities. These reported frequencies are military frequencies. 217.450 was reported in an early blimp file. I have personally monitored communications on 250.800 as indicated above. A monitor reports that even when the GY airship was stationed at the Glenview NAS near Chicago in 1995, only civilian channels were used. The last time he had an opportunity to examine the radio stack, there was no evidence of military or UHF capability.

Robert Wyman looked up Pompano Beach in the IFR directory, and as I suspected, there are no UHF air listings. So I'm fairly sure now, and Robert concurs, that the communications heard on 250.800 are a harmonic on the posted tower channel [125.400 x 2= 250.800-curious coincidence?]. The use of 250.800 has not been reported in any other area of operation. The US DoD IFR Supplement book, which contains all airports which can easily support military traffic, does NOT include Pompano... only Fort Lauderdale International and Fort Lauderdale Executive.

I understand that there are three Goodyear Airships [Blimps] in operation in North America with a fourth in operation in Europe. The American blimps are stationed at three locations: one on each coast and one in-between. The AMERICA, tail number N3A, is based in Pompano Beach FL [formerly in Houston, Texas], the COLUMBIA, tail number N4A, is based in Los Angeles, and the ENTERPRISE, tail number N1A, which was in Pompano Beach, Florida, is now in an unknown location. [It was reported to be near Houston TX, but that has been shown not to be true.] Each blimp is accompanied by a three vehicle ground fleet consisting of a van, a tractor-trailer, and a Greyhound-like bus. The communications between the blimp and ground crew are normally held on 151.625 Mhz.

While in Florida, the Goodyear airships generally work VHF tower channels up and down the coast while in enroute to various media sites. While on station, they monitor the tower which controls the airspace they're in. This fulfils their "required" air traffic control function, but more often than not, the tower will just give advisories about the blimp to other traffic, and you'll only hear the blimp when entering or leaving their orbit area.

While on station, the blimp itself will talk to other aircraft on a unicom or "chatter" channel informally used for the specific event. 123.050, 123.450 and others are used for this, and it allows the blimp, helos, and banner-tow aircraft to talk on the same channel. Again, this is the air traffic control function. Some sites, like stadiums, always use the same unicom frequencies during events.

The next function is more adminstrative than anything else. Goodyear has used those 465 MHz freqs for "company" information between the ground support staff and the airborne staff, including ground ops. at the landing zone. Other airships, such as those operated by Airships International, use other business band freqs for the same purpose.

Finally, the media crew will use everything from point-to-point microwave, to the standard VHF/UHF "remote broadcast" channels, to any one of the UHF itinerant/low power channels for media production, cueing, audio feeds, etc.

I have a report from a monitor that in December 1996 the AMERICA [N3A] was flying in the Pompano Beach FL area. A local TV helicopter and newscrew were along doing a story on the blimp. They used 132.000 the whole time. The reporter was on the blimp, and the videographer was on the helicopter taping the reporter. The reporter talked over 132.000 to the cameraman who recorded the audio [their wireless mics didn't work].

132.000 is an AIRINC frequency licensed in Pompano Beach under callsign WDF8. All of the licensed AIRINC freqs in this area were monitored but the the blimp was only heard this one time. A Transway International plane was also heard. The frequency is also licensed in Fort Lauderdale.

Another frequency to watch is 129.625...the banner-tow aircraft from North Perry have been on this channel. It's not known if this is new or old, an AIRINC license or what; it is being used as an air-to-air.

In the continuing Blimp saga....
Other sightings:

Sunday 10 September 1995, I saw a Budweiser airship flying north/south over the beaches of Monmouth County New Jersey. I think that I heard some comms between this ship and another blimp or airplane. They were using 122.850 [this frequency is commonly used by skywriters along the New Jersey shore.] I have no idea if this is a usual frequency for this blimp.

The blimp was silver and red and I could not see the registration number but I believe that the tail fins said RED ONE. There was a strong westerly wind and the ship was having great difficulty moving. It was tacking, much as a water vessel would- back and forth- east to west. It also seemed to be fighting strong downdrafts since the ship would tilt forward by perhaps 10-15 degrees [a guess]. It went from the north to the south, returned northward and then south west to [again a guess] Lakehurst or Mc Guire AFB. No other comms were heard. All previous blimp frequencies were monitored while the ship was in sight and a search was made of the VHF air band at the same time. Has anyone heard comms from this ship?

The Budweiser airship was seen sharing the skyline with Met Life over downtown Chicago in May 1996. It id-ed as BUD-1. The Goodyear blimp is in the Chicago area several times a year, although it will no longer be at Glenview, which is now closed. There was speculation as to where it might go. Among the places named were Midway, O'Hare, Palwaukee or perhaps Waukegan. Anyone in Chicage have a report?

A new blimp was launched in June 1996 in Atlanta, GA. It carries the Kroger logo and is the possibly largest blimp now in use. Called the Spirit of Atlanta, inital reports had the blimp in use to follow the Olympic Games. It has since be reported that it will be used as a police surveillance aircraft. Seems that Kroger was not an official sponsor of the games. A banner with the words "Atlanta Police Department" will be hung over the Kroger logo.

In May of 1995, the Marlin's Airship [white with pinstrips] was also seen off the coast at Pompano Beach FL, but no transmissions were heard from them. At one point as both airships were over the ocean, 3-Alpha called to Marlin on 250.800. A reply was received that I did not hear and a second message was sent from 3-Alpha to both Pompano Tower and the Marlin Airship. Does anyone know where the Marlin's ship is hangered and what frequencies are used? I was recently advised to also try 120.700 for general blimp traffic, although I have yet to hear anything on this frequency. A message was also posted that all blimp activity in Florida is on low power, non-repeatered itinerate frequencies used for short distances. These frequencies reportedly change daily.

In South Florida, the ships are re-worked each season [it seems] with new sponsors. They've had the Dolphins/Marlins/Panthers blimp, the Family Channel blimp [lightship] and others. Orlando has the Sea World blimp which sometimes comes down here too. In previous years, Bud One, Fuji, McDonald's, and others have been in town.

Regarding some of the blimps mentioned, it was suggested that a search by N-number be done. This would show who is really operating the corporate-sponsored ships.

Planned blimp activities in Florida this year included golf tournaments at Weston and Doral in late February, the Grand Prix in Homestead [also February], and the Lipton tennis event in March.

Our friend Eric seems to have a real problem with making accusations against people which are totally unfounded. When asked to provide proof to back up his potentially libelous statements, he stammers and stutters. He then launches into some totally flawed logic as to how he arrived at that conclusion. He's "always right", because of course, HE'S smart enough to figure these things out.

Case in point: a few weeks ago, he was insisting that a couple of respondents on this forum were actually the same person, using different ailiases. Reason? Because they were both AOL users. When pressed further, bright boy Eric offered the explanation that he had traced the paths of the messages and they were all the same. Even after several individuals explained to him that ALL posts from AOL have the same path because they ALL originate from a common master server, Eric still insisted that he was right and these terrible, awful AOL users were ganging up on him!

FYI:

According to an episode guide for the syndicated reruns of the TV
show SEINFELD (from alt.tv.seinfeld), the episode where
Kramer gets a scanner (and it ultimately ends up on Jerry's hands)
is scheduled for next Wednesday..
Mainly, Kramer listens to fire calls... an ulitmately he ends up
taking a ride on a fire truck.

From the syndication episode guide:

Wednesday, June 11th
"The Secret Code" (7.07)
George won't tell Susan his ATM code; Kramer gets
emergency scanner; Jerry offends handicapped store
owner.

In central N.C., the Seinfeld re-runs are shown on WRAZ TV-50
at 7:30PM each evening.

Repost for general interest:

To gain access to the NFM discriminator on this radio is easy BUT only do it if you feel capable of doing one very fine solder connection....

Basically what you have to do is connect a short length of audio coax via a smalll capacitor, to pin 14 of the mixer/nfm discriminator chip (MC3357P). This coax can be bought out to one of the spare phono or jack plugs on the back of the radio. There are several sockets on the back and I have used the "MPX" socket on my radio because I will never want to put a multiplexer on it! Here is how to:-

Components required:-
About 12 inches of thin audio cable
one 0.1 uF capacitor
one small cable tie (not essential but recommended)
one cup of coffee (to steady the nerves!) - essential

Disclaimer: The following is given in good faith. I cannot be held responsible for any omissions or errors, or to any damage caused to any radio howsoever caused....All care but no responsibiity!!!!

1) disconnect power and other cables at the back.

2) remove top and bottom covers.

3) from the top, locate the N.F.M. board (4.25 inches [115mm] from the back panel)

4) very carefully solder one leg of the 0.1 copacitor to the solder side of the pcb where pin 14 pokes out. Be careful to correctly identify this pin AND be careful with the soldering, it is a fine bit of soldering and is easy to short out this to the ajacent pads.

CHECK and double check that you have done a good "clean" solder job here - It's vital to be very careful - I cannot stress this enough!

Leave the capacitor hanging in the air for the moment...

5) Use a small needle file to drill a small hole in the top portion of the nfm pcb wher there are no tracks. through this hole, thread a small cable tie and leave in situ for the time being.

6) with a sharp knife, scrape a section of the solder resist from the top, right hand "Earth" track (as seen from the solder side of the pcb) and tin it with solder (To confirm that you have the correct track, it is the one connected to the can of the xtal on that board!)

7) prepare the coax by:-
(a) stripping back the outer insulation by about one inch. (25mm), twist the shielding together and tin it for about .25 inch [6mm] and then trim it down to this length.
(b) stripping back the inner by about 1/16 inch (2mm) and tin the inner conductor.

8) solder the screen of the coax to the earth track so that it will present the inner conductor very close to or touching the free leg of the capacitor.

9) now clamp this coax cable into position using the cable tie to secure it into position.

10) Solder the inner conductor to the free in of the capacitor

11) orientate the radio so that the front pannel is facing you and looking into the radio from the top, thread the free end of the coax to the bollom by way of gap between the main pcb and tha case at the back, right hand side (near the two white connector plugs)
tuck the coax under the big choke (the thing that looks like a transformer). BE CAREFUL not to put any strain on the coax. Leave a little slack ...

12) now turn the radio upside down and orientate it so that the dial is facing your right. The coax should be poking up at the left hand side nearest you!

To use the "MPX" jack socket as the access point:-

13) Identify the 3 mountin pins of the MPX jack. They are 2 5/8 inch [65mm] from the edge facing you, of the main pcb .

The pin on the left is the earth (ground) pin. The center if the "live" pin and the right pin is not used electronically (only as a mechanical mounting point and is ignored in this mod)

14) carefully cut the track leading to the centre "live" pin about half way along it's length (This removes the unused "MPX" signal to the jack socket.

15) prepare the audio coax appropriately and solder the screen to the earth pin and th inner core to the middle pin.

Replace the top and bottom covers, making sure that there is no strain on the coax and that it is not being "pinched" by the covers.

IMPORTANT - Add a "MOD NOTE to the inside of the radio and also in the instruction book:-

a) a small self adhesive lable stuck to the metal screen on the underside of the pcb with words to the effect :" 10/10/96 - track cut to remove mpx and coax added to give access to the NFM discriminator output"
b) similar lable on the back denoting the MPX now toi be "MFM Discriminator"
c) if you have a circuit diagramme, note the change also thereon!!!

The discriminator output is at a fixed level (about .7 volt) and totaly isolated from the volume control - the setting of the volume control will not effect the discriminator level. The squelch control WILL cut in and out on the discriminator line in the same fashion as oon the normal audio.

Happy hunting...

Donald Gray

Darn those rascals at Ericsson!

I bet there's no manufacturer who would sell digital radios to crooked US politicians. On the other hand, maybe we don't have any crooked US politicians....

Next thing you know, Ericsson will have television and semiconductor plants in China. No red blooded American company would ever do that!

I'm soooo disappointed in Ericsson. I'm going to tell my city to but their next digital system from somebody else ...even if it costs the taxpayers more.

Use another receiver to listen for the PRO-52's local oscillator
signal. It should be 10.7 MHz above or below the operating
frequency of your PRO-53, depending on the band.

On page 6 of Monitoring Times there is an article about using cellulars and driving. It says using a cell phone while driving is "about as risky as driving while close to legally drunk", so Mr. FCC instead of making laws protecting them from us scanners why not make laws protecting us from "cell drivers". I'm sure a lot of us can contibute stories about situations involving "cell drivers".

PS. drunk driving & cell driving is a life threating situation, scanning cordless & cell phones is not!!!!!!

3864. Yupi 7000 has bad imaging?

Newsgroup: rec.radio.scanner
Date: 1997-06-07 00:00:00 UTC
From: Xmiweber@davidson.edux
Message-ID: <Xmiweber-ya02408000R0706971958460001@news.earthlink.net>
Source record: 195231

I've got a Yupiteru MVT 7000 handheld scanner, and it seems to image a LOT. Do all small handhelds image a lot? For example, I get TV and Cellphone images when scanning the 440MHz band as well as the mid 150's I don't want cellphone images, unlike many others... No, the unit has not been modified, and it's even been sent back for service once.

Can someone with experience with this unit and other popular units on the market tell me if others are better? Or is this just a fact of scanning life? My PRO-2004 doesn't do this, but it's a desktop. I don't have any experience with other handhelds...

Any comments would be appreciated!

Well, you're typically not supposed to hear phone-patch calls, so that
might explain the odd group number. Even group numbers are to be expected;
see the last paragraph of page 49 of your user's manual.

Eric: I just love it when someone like you decides to speak for the
entire human race. How do you know what gives me a bad impression of the
ham community? I'll tell you what gives me that bad impression, the ARRL
requirement to stick with the code requirement after ALL governments and
military operations have decided to cease using it because of it's
inefficency. Drag your antiquated requirements into the 21st century
Eric and watch the number of "legal" hams drop lower.

I find it very interesting. It will definitely make me more cautious when doing transactions with people in other states. I will also never accept a money order that was post dated, and I will never ship any equipment before cashing the money order.

I think everyone can learn from this and make the internet a safer place to do business.

As for your inconvenience, by now I'm sure you've recognized the header, it hasn't changed in a while. Your solution is simple:

DON'T READ IT

My kids and I went to EDEN PARK on Memorial Day to participate in the VIETNAM VETS memorial commemoration. STING almost always flies by for this.....

The program was supposed to start at 10AM, and STING was supposed to fly by at 10:12 however....I was listening as they got closer to Cincinnati..They had a whole lot of places parades etc to fly by. As they got closer I could hear them on 139.975 AM just fine on my 2 meter larson thru the glass antenna. They would say bombs away sometimes...

Heres the scary part. They were flying by someplace else in Cincy when one pilot said JUMPERS! and the other said "We just missed one" Then they got busy setting up for the next place...which I think was just before us.. then at 9:50 they flew by us at EDEN PARK at 2500 ft in 1300 feet ceiling. There was only 2 of them and you could almost see them in the clouds .my kids missed it. Then they had more time to talk about the parachute they had just missed.

As they were heading for Blue Ash parade, which was next after us, the other pilot asked... Where was the jumper? The pilot that saw him said "HE SPLIT US" He said he passed BETWEEN THEM and just 50 FEET below them. The other pilot was impressed "WOW THAT CLOSE?" and the guy who saw him said he hoped that the jumper believed that they had seen him, when in fact only one of them did. They switched subjects after that and the other Pilot said that the GPS has been "RIGHT ON" all morning.

HINDSIGHT explains why this happened.. One of the Majors who spoke later commented that he was sorry that the fighters (STING) came so early and that they SHOULD HAVE ARRIVED at 10:12A. He hoped they would "COME BACK AGAIN".

Since they were at least 22 minutes early...Is this why they nearly missed the jumper????? The jumper probably wanted to be on the ground well before STING flew by. I'll bet he'll never forget seeing them!

I also wonder why only (2) jets? Usually they do the missing man with 4 planes. I also wonder why Toledo STING always does Cincy parades and such.. What about Springfield ANGB - SABRE (They're closer)? Maybe Sabre does Cleveland?

Last year's visibility was even worse and it was pouring down rain at Eden Park. Maybe next year will be better.

No trunking system provider is likely to consider design costs whose sole purpose would be to defeat some scanner enthusiast from listening to trunked systems. Trunking serves primarily as a means of increasing channel traffic density.

It is here, it works AS ADVERTISED, it has flaws, mostly minor, it even ocassionally spits out false talkgroups, but it still works better than anything else.

How long before obsolete, lets see, it has a computer chip in it, so I would say it is already obsolete. When will it no longer work, when and if either the trunk owners upgrade to digital, or Motorola figures a way to change the data stream to throw it off the "track". For $250, who cares, have fun, piss off your cops, and then find something else.

Tom

Know what? I just love it when people like you post such sarcastic
messages, and it turns out they aren't informed enouigh to know what
they are talking about. It makes you look like you just talk to hear
yourself.

It's the FCC that has the requirement for code here in the USA, not the
ARRL.
And they have that requirement because they *have to* have it. There are
international treaties that require it. Until those treaties are
dropped, the requirements will stay.

Hello all,
As far as I can tell from my monitoring the USFS is still using their 163 - 173 Mhz frequencies with the 400 Mhz link frequencies. I had received the updated listing for Ventura county fire awhile ago direct from them via e-mail and had noticed that channels 30D and 39R (CDF-2) had 151.265 listed as 151.625. I got ahold of them asked if they were aware of this. I was told the listing I received was a draft copy. But, when I received the full package in the mail yesterday (cover letter, laminated listing, new to old channel cross reference) they still had it listed wrong. Hope they have it programmed into their radios correct.
I know how much of a nightmare keeping track of what is programmed in what radio can be. Were up to about 98 programmed Saber I's now with about 10 different frequency sets. I'm glad we use the portable bases and Saber vehicle adaptors that use a handheld as the tranciever. We do have LZ99ZX Spectra bases but those have proven not to be rugged enough for a field training environment. Don't get me wrong the Spectras are a great radio but not for our use.
If your in the Port Hueneme / Oxnard area listen on 148.300. We use this frequency for the instructors to coordinate during the communications classes. Remember it's not always in use and is used on the Saber I's at 5 watts.

Best Reguards,
Jerry

Then hell, get a BC230xlt. It will get the images, scan up to 100ch/sec and
search up to 300ch/sec...longer battery life, extra battery and charger for
about $200 and you get a warranty. I know the 230xlt isnt a GREAT scanner
by no means but it is a good dual conversion handheld, but has more to offer
all around than what the Pro-39 does.

3886. $12.00 Computer Interface

Newsgroup: rec.radio.scanner
Date: 1997-06-08 00:00:00 UTC
From: John Montalbano <jrmont@iquest.net>
Message-ID: <339AF087.1D6C@iquest.net>
Source record: 194997

Build this Inexpensive Computer Interface to Your Scanner - Once you have tried it, you will never want to use the front panel keypad again.

I have been using a homebrewed computer interface in my PRO2032 for about two years. Recently, I modified the SW so that it can be used in almost any scanner. The interface uses just two inexpensive ICs and can be built for about $12.00. It connects to the parallel port on your computer. In the 2032, you make only 12 connections (no cuts) to the radio. Some people are already building wiring harnesses so that no soldering is required.

The SW allows you to manage your frequency databases in a user friendly win3.1/Win95 program. You simply drag frequencies from your database to your channel bank map. You can then download the channel maps to your radio. You can also select popular scan ranges such as weather, aviation, ham etc. Many new features will be added as the project develops.

For those who can wire up a few ICs and don't mind making connections into their radio, this is a great alternative to the more expensive (and more feature rich) interfaces that are commercially available.

My goal is to make this a public domain, homebrew project that many can contribute to and share experiences about on a newsgroup like this. I will provide SW for those who handwire the circuit as I did. I need some feedback to know if there is enough interest out there in this approach. Typical responses have been "This is great, you should make these and sell them!" Is that what is preferred? I do have some alternatives that I can pursue to make this available to people who are interested in simplifying the construction (A PCB & Kit) or buying it off the shelf (The serial interface version of the project). I would like some feedback. Send me some email at jrmont@iquest.net and let me know of your interest level and kitbuilding abilities. I will reply with the URL of my WEB page that describes the project. Thanks.

Bill (to quote you...),

Know what? I just love it when people like you post such sarcastic
messages, and it turns out they aren't informed enouigh to know what
they are talking about. It makes you look like you just talk to hear
yourself.

> It's the FCC that has the requirement for code here in the USA, not the
> ARRL.

The FCC would have dropped or drastically changed the code "requirements"
years ago had the ARRL not protested so vehemently ...

> And they have that requirement because they *have to* have it. There are
> international treaties that require it. Until those treaties are
> dropped, the requirements will stay.

The treaty requirements can be "excepted" by national administrations
(Japan and others have done so ... Poland recently joined the crowd,
according to a recent announcement) ...

Additionally, the treaty specifies NO minimum speed requirement ...
a 1 character per week speed limit would meet the requirements ...

This is just more typical pro-code excuses for maintaining antiquated
"requirements" ... nothing more ...

Unfortunately, the USPO will not allow you to specify the form of payment
for a COD. They will accept any payment, including bad checks.

Well, I might define "beat" a little better. My AR8000 does, after all,
have alpha tags on the frequencies and interfaces with a computer. My
TrunkTracker definitely seems to scan faster as well as performing it's
key feature of trunk following.
Harold

>dropped, the requirements will stay.

But there is no treaty requirement for 13wpm or 20 wpm. Those are
past choices of the FCC with strong ARRL support at the time.
The FCC could set a one wpm code speed test and that would
totally comply with the international treaty. That is why Len
Winkler's WOG and several other alternate license proposals
COULD be implemented today with no change in inernational treaty.

In fact, many other nations have lower CW requirements than
the US does for General and above.

Folks, anyone out there using trunker.exe to drive your scanner?
I've got mine reading data from one scanner and driving my AOR8000
based on group or individual priorities (max(group,caller)). One question
-
Have you been able to get COM1 to successfully emit serial data? the
problem I had was that no matter what mode I set in the control
register, the data seemed to come out as 5-bits/no parity. So I ended
up reading the data channel on COM1 and driving the 8000 via COM4...

any experience would be appreciated..

NRF

This is especially so with the Pro-39, because a properly modified unit tunes in the proper 30kHz steps that the cellular freqs require, not the 12.5kHz steps experienced if you rely on the image technique on an unmodified unit.

One of the minor flaws mentioned in previous postings. Expect the base station unit(s) to have this, if they are smart. Otherwise a good cheat sheet.

Tom

Sorry but that is wrong. You can specify cash only and the Post office
will collect the cash and send you a postal money order. It will cost
the person that receives the article an extra 75 cent for the money
order. Drawback to this is it sometimes takes a long time for you to get
your money order.

Try online at:
http://www.radio-guys.com/scanners/2bc235rg.htm

Got mine there .. works like a charm, but I'd like to see the mods to
disable battery indicator and maybe cell unblock.. . if there is such a
thing.
Scanner World in Albany, NY also has them, I believe.

From the FAQ article SCANNER RADIO REVIEW BRIEFS:

[...]

PRO-2037: 1994 vintage. Triple conversion all plastic base
scanner made by GRE. Home version of the PRO-62 portable
but with more intermod. 200 channels in 10 banks, one
search bank, selectable AM and FM. Uses up conversion
circuitry but inadequate front end filtering still allows
images, though not as bad as in 10.7 or 10.8 MHz IF
circuits. Crisp, respectable audio given the top mounted
speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in
July 1995 Monitoring Times.

[...]

Reprints of articles from Monitoring Times are available
for $3.00 each plus a self-addressed stamped envelope from:

Grove Enterprises, P.O. Box 98, Brasstown,
NC 28902. For a free catalog, call (704)837-9200.
Telephone (orders only): (800)438-8155.

Note: I don't get any part of the $3.00.

In reality it is illegal to take your HANDS off the wheel while driving!
Eating, drinking, even playing with the AM/FM tuner while driving is
ILLEGAL in most states.
A car full of teenagers was almost killed about a year ago because the
driver was playing with the radio and the road curved, the car went
straight into the woods injuring everybody.
It's not an enforced law but if you check the books I bet it's there and
falls into careless driving.
Anything you do to distract you from pointing that ton of steel down the
road safely can be called "Careless driving".

I see people with a newspaper spread across the steering wheel in the
morning commute! If I were a cop I would stop them, roll that paper up and
BEAT them almost to death with it!

And yes, I have seen many people talking on the cellphone almost kill
somebody because thay are too tied up with what they are talking about on
the phone..

Not so much as the scanner being set in a certain way but the
workmanship of the install has to be up to par. Check all your solder
joints and connections.

As the install manual indicates most initial malfunctions are due to
improper installation.

> key feature of trunk following.
> Harold
Well I will tell you one thing
i will take a trunktracker without alphanumerics anytime
over a conventional scanner that costs $600.00 with alphanumerics
that is full of birdies and intermod and even Floating birdies

We have nothing but trunking here in Orlando as far as Public safety
goes so a trunktracker is essential

and by the way alphanumerics is just a detail

I can always use my brain to remember the more important codes

Ooh, you're soooo smart.
However, it's still the FCC who requires the code, here in the USA.
You can blame the ARRL all you want, but the FCC makes the rules.
>
> > And they have that requirement because they *have to* have it. There are

Ooh, you're soooo smart.
The treaties haven't been "excepted", so they stand.

>
> This is just more typical pro-code excuses for maintaining antiquated
> "requirements" ... nothing more ...

Oooh, you're soooo smart.
If you had actually been following the discussion re: CW requirements,
you'd see that I'm definitely *NOT* in favor of them.

Explaining why they are there is not the same thing as being in favor of them.
But then, being so smart, you knew all of the above, and just posted to test me, right?

Please DONOT Talk down to a company just because you may have had bad memories. I work in the highest volume radio shack in the western part of the US. Yes we know the product. Yes we have answers. And YES we use the catalog as a referance. If you can remember 300,000 stock units plus the 1 million other parts available from special order warehouses and private vendors, along with knowing all the prices, if they are on or going on sale. Well please e-mail me your resume. I WANT YOU to work in our store. Better yet the boss can fire us hire you and make more money.

I see 100-200 customers aday. Our store has a name database with 26000+ names (active customers with in the past 5 years.) I feel WE are a real Radio Store.

Enough

I have one of these beauties (which WILL receive cellular freqs.)
Is there any interest in swaping for a Trunk Tracker? I really have no
interest in cellular, but this rig will do the job. Its range is 25-550
and 800-1300 MHz.
Almost DC to Daylight.
Serious inquiries only.
I have no manual but the radio works like the day it was born.

Hi,

I need help identifying a scanner I used to have. A few years ago, I bought it from Radio Shack for $200. It was a base unit, and had 200 programmable channels, with hyperscan. I want to say that it was the Pro-2026. I looked on RS's site and it kind of looked like that one. I am interested in purchasing a scanner like this again, and was wondering what the going price was. Thanks for your help!

Sorry, Drew, I can't oblige the request for some waves of Eric, as I don't live in Phoenix, and since Eric is primarily active on 2 meters (he may not be on 11 meters at all). However, Frank Burns and Howard Lance Kingston were heard on 27.365 Mhz LSB this afternoon around 22:30 UTC, so at least we know that the old toad Franky and Howie the Hairlip are still around!

Be VERY careful what you ask for; you just might get it. In addition to cell phones, I would guess the use of CBs, ham radios, GMRS, business band, and all other forms of personal communication equipment would be banned while driving.

Frank E. Burns is a licensed Technician class ham operator (KC7VEI), but one of the operators I heard on 27.365 LSB this afternoon kept insisting that Franky was no longer welcome on 2 meters or 6 meters in Phoenix (I wonder why?). So apparently ol' Franky has returned to 11 meters on a somewhat limited basis--when I heard Frank this afternoon, he didn't seem to be interested in spending as much time winding up Howie as he has in previous years.

Leon,
Yes, the 741 has worked fine for me with ACARS, Pagers, MDT and whatever.
Except for ACARS I used the discriminator output on my scanner seems to be
a must. There are a number of sources of schematics for the interface. DO a
search on the WWW for Hamcom. I have read some remarks that the 741
doesn't cut it but it seems to work fine for myself and two other locals.

==========

Another method I would try is to find channels that DO work, then,
remove the crystal that works and substitute the suspect crystal. If it
works in that channel, than the crystal is probably good. If not, than
I would mark the crystal as suspect. Another possibility is using
another scanner to test the crystals. The Regency Monitoradios pop up
at flea markets and yard sales for 5 or ten bucks. Best place to get
these are yard sales in you local area--most at least have basic PD and
fire xtals. NOTE:Bearcat radios use a 10.8 MHz IF and will not work
with RS/Regency crystals.

If you live in a busy metropolitan area, expect to get a lot of cellular overload on conventional 800 Mhz freqs.with an 890XLT. Friend of mine bought one, and it is plagued with so much cellular overload, that is it literally useless on 800. We live in a very populated area of metro Chicago, and have TONS of cellular towers in our area. Just some info before you buy a "dual-conversion" scanner.

> with cell and ctcss.

Hey! You're not alone! I've got one of those clunkers in my bedroom also!
I was wondering if I bought it and it instantly went off the market. I
went and got a pro-60 and it sits proudly next the the 210xlt so I'm not
missing much. I got my 210 from ScannerWorld for $149! (About 5 years
ago!) Now look at scanner prices! But if you get any mods or other
information on the 210xlt, mail me or post a message. (I'm not that active
on newsgroups though so mail me first!)
Thanks
Jake

Well, Motorola might tell that to a new customer - they have been known to stretch the truth a bit when selling a system.

However, I am willing to wager that ALL of their existing users would laugh if one of their salespeople told them that. A fair share of them already have scrambling capability on their analog systems, and there are not any consumer scanners that can descramble the signals. And, the ones that don't have scrambling have probably been pestered numerous times to get it.

I have a complete listing of Ventura County Fire Freqs which also
contain USFS and CDF freqs. If they are in any way used as mutual
aid then they will be listed here. This list is current as of May
when they reorganized all Ventura Co. radio channels.

Are cell freqs licensed in a different way than normal UHF and VHF freqs are licensed? I ask this question, because as I searched my Person database for some freqs that I *accidently* found during a search of he 800 mhz band with out finding any matches. I was hoping to be able to search for cell tower freqs by searching by Latitude and Longitude for specific towers but this didn't work. Anyway, I would appreciate anyone with any insight about this topic.

>
> Can someone explain the difference between WFM, FM, AM, LSB, USB?

WFM is Wide Band FM (used by TV stations audio and FM Broad-
cast stations. Typically 15 KHz wide

NBFM is Narrow Band FM (what is used by most all public service agencies).
It is typically 5 KHz wide.

FM is Frequency modulation. The audio swings the transmitter frequency
the width of the carrier.

AM is Amplitude Modulation. The audio is superimposed on a fixed width
carrier frequency and varies in amplitude but not frequency. Contains an
equal sideband on each side of the carrier. Typically used for aircraft and
short wave radio stations, as well as AM broadcast stations.

LSB is AM with the carrier and upper sideband removed for transmission.
Typically used for ham radio and aircraft control over the oceans.

USB is AM with the carrier and lower sideband removed for transmission.

antenna
> with a bnc connector ?

I bought a cheap 3db gain Radio Shack cell phone mag mount for my truck
and their gain type duckie for portable use. The duckie is definately
longer
than the stock antenna though. They have a TNC (cell phone plug) to bnc
adapter for sale also. Works great here. Any cell phone antenna will
work great, and they are dirt cheap.

Source record: 194888

If you're really in a bind about batteries for your BC200xlt, open up the battery pack, (remove a couple of screws), unsolder the 4 AA nicads (2 connections) and wander down to your local Radio Shack. There you'll be able to purchase two sets of soldered nicads for around $7.00 each. Back to the house and solder those puppies together (2 more connections) then into the pack (two more connections). Recharge for approx 12 hours - bingo! ... a new pack for a few minutes work and $14.00

BAHHHHHH!!!!!! ROFLMAO!!!!!!!!
They find stolen (insert anything here) so often that nobody bothers
with theft insurance any more!!!!

How will he find it if the thief dosen't speed, isn't black or hispanic,
etc? The pig writes the report then goes back to traffic shakedowns.

3978. Need Info - Keypad Matrix - any radio

Newsgroup: rec.radio.scanner
Date: 1997-06-09 00:00:00 UTC
From: John Montalbano <jrmont@iquest.net>
Message-ID: <339CE067.551B@iquest.net>
Source record: 194891

I posted an article this weekend describing a $12.00 computer interface project. Several people are already building prototypes. It would be a great help to them if I could post the portion of the schematic that shows the keypad connections to the CPU or some descriptive information (e.g. CN6 pins 1-8) that tells where to connect to the rows and columns of the keypad matrix in a particlular radio. I already have the PRO2032 and thanks to "wiggie" I now have the 2004,2005,2006,2035 and 2042. I am especially interested in the 2024 and 2026 right now but having as many of these as possible will help make this project go smoothly for the people building the project. I would appreciate it if you can provide this information as

1) A scanned in image including a blowup of the keypad matrix and any relevant components (connectors, diode packs, resistor packs) that one could connect to.
2) Some descriptive text. For example in the 2032, The columns (X0-X7) can be found at pins 1-8 on CN6. The columns can be easily connected to at JM80, JM83 and JM84.
3) A fax to 317-570-3122 to John Montalbano including a blowup of the keypad matrix and any relevant components (connectors, diode packs, resistor packs) that one could connect to.

If you missed the first post on the project and would like the URL for the page. Drop me some mail. Thanks

This may not be what you want but this is what I did.

If you just hook up a voice activated recorder the squelch will always
be broken and it won't work for recording only transmissions.

I bought a voice activated tape recorder (about $70).

And an Antenuating antenna part (spelled it wrong, and probally got the
name of the part wrong, but I'm close enough) from Radio Shack. (about
$2, I think) Looks about 2" long, red in color, about as fat as a pen).

Then from the scanner's headphone jack I run to the Antenuator(sp) that
is pluged into the tape mike input.

Works like a champ.

I'm an EMT, and I must say that the police department in my community is
TOP NOTCH!! The Police officers ask repeatedly if we need help, and
will even, occasionally, roll to a code with us to assist in the resus.
I am very pleased with the Police service here. "Police" as the term is
used should be replaced by "individual Police officer". We all try to
do the best we can and some just CAN'T handle another persons job when
they themselves are already up to their ears in paperwork. The old
stereotype is just that, the OLD stereotype.

Give these guys/gals a break. There are good ones too!!!!!!

Dale Jeppesen
EMT

There must be a tape recorder switch circuit in every one of Bill Cheek`s
books. these are universal types, which will work with any audio input, like
from the Tape recorder or aux output of a scanner, not specific to any brand.
Get one of Bill`s books on scanners and go to it...

It depends on what you want to monitor. Yes, those of us who don't want nosy people listening to our phone calls have digital, but analog is still the main mode in smaller markets.

As far as trunked, consider a Uniden TrunkTracker. It will only track trunking data on 800MHz, but it has been very valuable to monitoring public safety and works very well (I own one).

There is still much to listen to on VHF high band (alot of public safety, taxi's, itinerant business stuff, amateurs, military, commercial aviation, etc.) The same can be said for UHF (broadcast remotes, public safety, taxi's, special industiral, amateur, alot of business and itinerant, mall security and other security, GMRS, FRS, paging, even some IMTS phones in some areas!). Of course, 800 and 900MHz offers most public safety, alot of private business systems, paging, broadcast remotes on upper 900, etc.

Yes, there is ALOT to listen to on a scanner. While digital is making great headway, analog will be here for QUITE a while. Many agencies and private businesses have invested thousands of dollars into conventional and trunked analog systems, and they aren't going to trash it all just to have the latest and greatest. Plus, many are quite happy with their exsisting systems, and don't desire to go digital. (If it works, don't fix it!)

Gotta get a handle on the handlers!!

The Trunk Tracker manual is available by "fax-back" from a place caled CEI (Communications Electronics Inc.) in Ann Arbor Michigan. It is 39 pages long and is an exact duplicate of the TTracker manual. Of course, there are also some advertising involved.

The nuber is 313-663-8888. You will need to call from a fax machine's handset, follow the voice prompts, and the manual will come through. By the way, they have them in stock, unsure of price.

No, I'm not saying that at all.
If you read the quotes above, all will see that *you* said that.
Is this your whole argument? Try to make others look like they are
saying things they aren't?

PAY ATTENTION, SON: Follow the thred and subject, and you will see that
I'm *not* in favor of the code requirement.
However, I *am* in favor of making sure some people who shall remain
nameless (because they like to hide behind a handle like Sky King??)
refrain from posting inane comments when they have nothing constructive
to say.
If you are wrong, have the balls to admit it. And you're wrong. That's
why you posted this message. All it does is attack. This is proof that
you don't know enough to continue the thread.

Every once in a while, someone will "camp" on a frequency, to keep it
open for their own use. The reasons vary, but the user generally feels a
need to keep others off the frequency, so they can use it whenever the
need arises.
The transmitter just idles away, with no modulation, just a pure
carrier.
I have no idea of whether this is legal.

Ah, nice to be young! The 8000 has 1000 frequency possibilities in 20 banks as opposed to the 300 frequency and 10 bank "limitation" of the 235. Although it's not full, I do lose track (no pun intended) from time-to-time.

I saw an earlier post that said it all. What do you want the scanner to do? If it does it, that's the "best scanner."

Regards,

Harold

That is very true. I agree with you in that the brain
game is the best to play with those numbers flashing on
by on their track to oblivion-repeated over and over again.

The real problems come when you get a county system in the
588's and 589's who have about sixty freq's for the county
and there are four more counties who operate similarly.

In time the important ones will be known. The problem comes
from those freq's that are used for serripitous activities
which you see and cannot figure out who they are.

There is a tv station that has the new 9000's and all the
identities are in alpha...reason: turnover is great on the
assignment desk and too many interns to train to know the
ones to watch for...so practically the newer alpha's make
sense.

I have an MR8100 and never put it to the computer to do
alpha...but most tv stations who still have them do.

That goes for newspapers and wire services and news radio
stations...too many people coming in at any "minute" and
hearing "a breaking" story and they don't know where it is.
They see and they don't see. With Alpha..at least they can
refer the more experienced listener to the name they saw.

Alpha helps when there are just too many bodies going by
playing "professional"....alpha keeps them out of trouble.

bill conduit
etc.

Could be the discontinued Pro-2006. There should be a model number
silkscreened on the front panel, as well as on the sticker on the
back.

Message-ID: <339d4a7b.2248127@news.mindport.net>
Source record: 194961

Here's a couple of things I found out that help get more mileage out of the available channels.

If you want to listen to two or more trunk systems that are located far enough apart from each other that you can't hear more than one data channel at a time you can put two or more systems in the same trunking bank. It don't matter if you enter them all at the same time or add them later as long as it was originally programed as a trunking bank. Of course this works best if all the systems are of the same type otherwise you have to change the type as you move from one system to the next.

Along the same line, you can add conventional frequencies to a trunking bank and scan them in conventional mode. Just lock out all the trunking frequencies. It don't matter if they are locked out during trunking and the conventional frequencies don't interfer with trunking.

>Any help would be appreciated. Thanks in advance.

>Mike

I have never seen shareware or freeware ACARS software. It seems that
commercial software has been the only stuff available. Even identical
software (such as the one Lowes and AEA uses) are entirely different
from a demodulator standpoint. The AEA uses the more traditional
serial-port device, while the Lowes uses a parallel port unit.

The software must match the demodulator or it won't work.

Unless something has changed, you gotta spend $60-100 for a commercial
package if you intend on doing it honorably and legally.

If you value your time, you can spend more than this trying to rustle
something up for free.

Anyone have any opinions on either one of these scanners? I was thinking of buying a used AR8000, but saw that I could buy a new R10 cheaper than a used AR. I like some of the features of the AR8000 - computer interface, Opto Scout interface, and the backlighting that is supposed to have a heavy duty regulator (I do a lot of listening at night and usually don't want to have light on to see). Which do you think is the better scanner? Thanks for any help.

I would assume they're using commercial units. Stop by a well-stocked
video store and look on the shelves. The operating frequency will be
clearly labled on the box (there are a number of them).

You were the one that brought up drug users into the thread.
>
> Call a cop? What's he going to do? Write a report? Oooooooo!
>
> Protect your _own_ property! No one else is going to do it for you!
>
> Bobby
> --

Yes...he will write a report. Then he calls dispatch and they enter it into NCIC and any local computer system. If anyone in the country runs the tag or VIN it indicates it as a stolen vehicle. Then the police make the arrest (or recovery if vehicle is abandoned) and notify you that they located your stolen property. Then they do what they can to identify the thief and hopefully put him in jail with all the drug addicts. But since that is all the cops will do for you, and you seem to think that is not enough, I still think you ought to call someone else who can do so much more...like, uh...like the, hhh....ummmm...well, someone can surely do more for you than the police.

4032. Seeking info on HyGain ProScan Scanner

Newsgroup: rec.radio.scanner
Date: 1997-06-09 00:00:00 UTC
From: jmdavis@sos.net
Message-ID: <339c8f6b.261710644@news.nas.com>
Source record: 194982

While cleaning out the garage in preparation for a garage sale I came across a HyGain ProScan scanner. I recall that this item belonged to my father back in the 70's. It has 16 channels and is crystal controlled. The crystals that are in it range from 4X.XXX to 15X.XXX. I suspect these are the old frequencies for the PD, FD and SO from my old home town.

The front plate indicates LB - VHF - UHF capability. The unit seems to work, the LED's on the front panel scan when powered up (except for 3 which are burned out). None of the frequencies correspond to anything local and I do not have an antenna with a suitable connector so I don't know if it will receive a signal. I am optimistically assuming it will.

Can anyone provide any additional information on this unit? Specifically, what frequency ranges can it receive? Are crystals still available and from where? If it does not require a significant investment, I would like to rehab the unit for use as a bedside scanner to monitor the local PD and FD.

Thanks in advance for any assistance.

John Davis

And all I have ever wanted is a triband portable with tx and rx of 136-174, 406-512, and of course 806-866 SMR band. Oh, has to have DPL encode and decode, prefer at least three watts at 800, and for all the self apointed FCC cops, I would like Part 90 type acceptance as well. Privacy Plus and Smartnet would be nice also. But alas, it doesn't seem to be in the cards, so I had to settle for a Yaesu FT50 and a Motorola MTX8000.

Someday maybe everybody's dreams will come true!

Jose,
I have a review of the R10 on my web site. Go to the
web page below and click on Radio Monitoring. Find the R10
in my list of receivers and on my R10 is a link to the
review.
You might also want to check out my Welz WS1000 and
Yupiteru MVT-9000 reviews which also compare and contrast
the AR8000 and IC-R10.
Happy reading!

First, you need to determine what it is you want to listen to. If you are interested in just local police, fire, etc., then a simple 20 channels should do. If you live in an urban or city area, maybe 30. If you are interested in listening to a great variety of things, or covering several departments and/or agencies at the same time, then the 200-300 channel scanners will be better. The advantage with the more expensive units is that they will come with a "search" feature, which allows you to search between two selected frequencies. The scanner will simply stop when it receives traffic. You can write the new freqs down, enter them into your memory, or disregard them and go on. A great feature.

Second, will you using it at home or on the road? There are scanners for both home and car, and then there are those for JUST home. Be sure the radio you buy will operate in all the areas you wish it to.

A "modified" scanner is one that has been aleterd electronically to operate outside the intended bands or other parameter. Modified usually refers to scanners with the "cellular" frequencies restored. However, this will void most warranties, and if sent out for service, the factory will block them out again.

Hope this helps. E-Mail me at SCaron0911 if you need anything else.

This is also true on our side of the pond - for the last few weeks there
has been significant activity on 17m, 15m, 12m, 10m and 2m (I don't have 6m
here). I dont (admit to) any listening to CB but that was open too...

Could this be the beginning of the end of the bottom of the cycle ?

Glenn,
Range at this power level has many variables. One of the major ones is terrain. In a residential area you may only realize two miles, while on an open prairie you may get out four or five without much problem. Keep your antenna fully extended! Don't think you'll get the same range with a "rubber duckie"!

I said 1 watt = 1 mile because since the power output of CB is so low,
you can make a general practical statement. (if you can transmit
1000W power output, I did not make a such statement) Usually, 4W
output has 4 times of distances of 1W output. It is a practical
sense (not theoretical sense) in the low power output. I learned
from the experiment.

The next Trunk Tracker discussion will be held on Monday June 9th 1997
at 8:00pm Pacific Standard Time. Everyone is invited..

Location: http://www.wolfenet.com/~daydream/ (just click on chat room)

All monitoring discussions are welcome but the emphases will be on
Unidens new Trunk Tracker and trunked radio systems. Please do not
miss this unique experience.

4047. NYC Trunktracker codes

Newsgroup: rec.radio.scanner
Date: 1997-06-09 00:00:00 UTC
From: morrisonj@usa.net
Message-ID: <5nfpfb$42d@dfw-ixnews9.ix.netcom.com>
Source record: 195058

Hello everyone,

For anyone interested, I got the following talkgroups from NYC's DOITT system earlier today. I had the Trunktracker set up as Type I using preset fleet map P4.

000-2 Security of some sort
000-6 OEM Base
000-7 "Fox" units; escorts of some sort
000-8 FDNY Marshalls
300-1, 300-2, or 300-3, Unknown crew dispatched to reported massive sink hole
300-4 "NCB" whatever that is
700-0 DEP to Hazmat

There were also some others but being Sunday it was mostly a pretty slow day. I don't know if fleet map P4 is the best one to be using, however it definately followed all transmissions.

Later,
JohnM, Babylon, Long Island, NY

I've got the schematics for the hardware in the latest Popular Electronics magazine. I'd like to write my own program though. Being fresh out of PSU, I'm fairly competent in assembly language for the Motorola 68HC11 microcontroller, but I'd rather try something new. Does anybody do any higher level language programming for PC's? Specifically for the purpose of decoding ACARS type signals through a schmidt trigger setup? I've heard C++ is a good language and is very popular, but is there another language I can take inputs from the ports and use them to do things? Any ideas?

thanks..

What all this crap means is some people are just too damn LAZY to learn the code! Since they don't want to take the time or effort to learn it, they want the requirement changed to make it easier for them. AND, to set the record straight, CW is one of the more efficient modes, both in bandwidth and power requirements. Try digital communications on 100 milliwatts...it'll get you nowhere. Just so those who oppose the CW requirements don't think I'm an old CW person that believes in exclusivity, I hate CW. BUT, those are the requirements, and I think they should stand.

Thanks to the ARRL, the U.S. Amateurs will be the last on the face of
the earth to be rid of that ridiculous code requirement. It will
probably be about a hundred years after the rest of the planet drops
it.

I have for 5 scanners for sale and have lowered the prices since I posted them last, details are as follows....

Radio Shack Pro-2006 (800Mhz) $250.00
Radio Shack Pro-2024 $75.00
Radio Shack Pro-43 (800Mhz) $200.00 (have 2 available)
Uniden/Bearcat 890XLT (800Mhz) $150.00
Regency/Wilson MX3000 $50.00

Prices do not include shipping.

Email me at jenifer@halcyon.com if interested, I may consider interesting trade. These radios are located in the Seattle, WA area.

Date: 1997-06-09 00:00:00 UTC
From: morrisonj@usa.net
Message-ID: <5nftcf$7gb@dfw-ixnews9.ix.netcom.com>
Source record: 195069

Anyone have at least rough boundaries for FDNY*EMS's Manhattan North, Central, South; Brooklyn North, Central, South; Bronx North, South for dispatching?

Thanks much,
JohnM, Babylon, Long Island, NY

What your saying then is that the FCC and other foreign governments
have so little trust/faith in the ham operators that they intentionally
keep antiquated rules in effect to stifle the ham operations. Wonder why?

is you living in the USA?

where you been last few days ?

go to: http://www.grove.net look for articles on TT

go to: http://www.altavista.com search for trunktracker
.yahoo.com search for search engines
then "trunktracker"

you will have many search engines to play with....

http://www.ace.communications.com they mention it

this will give you a start and a finish and an in-between
view

Are you sure you're not hearing internal birdies from your scanner? All scanners have some as a result of the synthesizer process. If you still hear them with the antenna disconnected than that's what they are.

From: no@mail.please
Message-ID: <5ngooi$t87@svna0001.clipper.ssb.com>
Source record: 195085

I checked back through the group and didn't see any reference to this, so I apologize if it has already been asked.

Does anyone know what the most common frequencies are for the wireless mic's used for the police who have video cameras on their dash ?

Also, what should be expected for receive distance on these?

Any and all information is appreciated.

Mike

Search between 169-174 Mhz. Or consult FCC Freq allocations for exact
wireless mike freq's. Range 1 block or less. If several cars have them
several freqs will be in use as if they were all on same channel, tehy
would step on each other.

Ask any HAM, Check with your local Amateur Radio Supply house, check any
of the ham radio packet newsgroups. There are many makes and models of
TNC out there and some specificlly have interfaces and internal software
just for APRS and GPS combos. This is a very popular use of Packet
radio since the onset of APRS software.
Have fun..

First thing I did was throw away the shitty Uniden antenna anyway. It is not real great at 800Mhz and surely nobody actually bought this scanner for anything other than Motorola Trunk tracking????

Many aftermarket 2 way antenna makers have much better 800Mhz flex antennas with a BNC.

I, however, would hardly classify anything dealing with the antenna as a "serious defect in the Trunk Tracker". Not having alpha labeling is a defect, not serious, antennas are all over the place.

Tom

4087. Re: Finding Trunk Tracker I-Ds

Newsgroup: rec.radio.scanner

When converting Motorola talk group IDs (Hex) to Unidens Decimal, it will convert to a number divibable by 16/32 as Moto Talkgroups are a product of Hex (i.e. 16). If your Type II code is not evenly divideable by 32, it is most probably a false code. There are a very few exceptions, but these are rare.

I can do better than that!
In downtown Phoenix, I can cover both fire and police with *NO* antenna
at all on my PRO-43.
Receiving with little or no antenna is not unusual in many areas.

Message-ID: <339E0AA2.6FC8@ix.netcom.com>
Source record: 194751

I have a Diamond DJ 1300 discone installed right now and have been given a new RS gound plane antenna (3 vertical elements, 25-100 mhz).

I know that the discone has no gain, so would I benefit from installing the ground plane and takeing down the discone ? Will the RS ground plane give me any gain at all and will I need to point it in the direction of the stations I would like to monitor.

I live about 60 miles from Travis AFB and am having trouble hearing any comms from there. But I can receive some transmissions but very weak. On the other hand I can hear other stations that are up to 100 miles away.

Any suggestions would be appreciated.

Monty

Yes..the choppers will communicate on the same tactical freqs that the police patrol units communicate on.

However, you may also find them communication between choppers and with their base on an aero freq. Example: in New York City, the NYPD Aviation units talk on 123.10 MHz AM, which is an aeronautical freq.

Good Luck..you can hear some interesting stuff on these freqs.

Don

Nope it is a EF Johnson Multinet system. It is not very difficult to monitor at least here in Vancouver area. They have two main sites north and east and each only has a few channels. The conversation usually only stays on one channel too unless a phone or another radio call is on their home channel than it jumps to one of the other channels and will go back to the home channel as soon as it becomes free again.

Greetings,

I have a new BC860XLT for sale. 10 on a scale of 10. Original box, manual and accessories. Purchased within the last 45 days. New list at AES is $189. Will sell for $110 or trade for a handheld scanner. (Sport Cat or similar)

Reply via private email please.

When converting Motorola talk group IDs (Hex) to Unidens Decimal, it will convert to a number divibable by 16/32 as Moto Talkgroups are a product of Hex (i.e. 16). If your Type II code is not evenly divideable by 32, it is most probably a false code. There are a very few exceptions, but these are rare.

>Some nut
> walks into McDonnald's and starts shooting up the place. How can the
> police protect me at that moment when I am in danger? By the time they
> get there, he's gone and we're dead.

Well, this happened in Little Rock, and the officer, who was there eating
attempted to apprehend the suspect, but got jumped by an accomplice
that had been sitting in a booth watching for police. The officer is now
dead, but the public was spared... Also, I believe the police did a
pretty good job in that LA bank robbery. Again, no civilian deaths. The
key is to have an immediate way to alert police (alarm co with an
audio monitor and a direct line to dispatch), and a police force that is
not so bogged down by BS complaints that they have enough available
units to GET THERE while the crime is still going down.

> Police pick up the pieces and **possibly** prevent the perp from doing
> it to someone else. But it's too late for me. When I need _immediate_
> protection the only person I can _really_ count on is me. No disrespect
> meant, just the a fact of life. Am I wrong?

Actually, I think the crime rate would be considerably higher if the police
were not on the streets. While they cant be in your home protecting you,
just the fact they are out there is probably decreasing the likelihood of
your
being a victim. When people realise the police are not marriage
counsellors
or brokers in civil disputes, there will be many more police available to
prevent crime.

Wrong. An extra battery pack is shipped so that you can pop
one in immediately to replace the one that just went four
feet up.

> 3 When searching you can have the AR8k store the
> found frequencies automatically with an alpha tag
> automatically created for you.

You'll need those pass frequencies to keep from stopping on
all the birdies you might hit.

> 8 The AR8k can search for you while you eat dinner

I wouldn't say few these days. Seeing the price that this
radio commands, you had better get milcom coverage.

> 11 Many mods to improve the quality or add more
> functionality to the popular AR8k are available.

One must ask, if this radio is so great to begin with, why
are there so many mods to make it "better"?

> 12 The AR8k can land you in jail if you tape a
> politican's phone calls. I would never tape my
> congressman Newt Gingrich for that reason! The
> 235xlt doesn't even offer you that option to break

Ah but it does! Just sit close enough to the cell tower and I
guarantee you'll pick up images and intermod from quite a
number of cell conversations.

[snip]

And you forgot a couple
13 One AR8000 is worth two BC235s...or so it should since
you pay more than double for it. Or shall I say, you
us to be able to do so before Uncle Sam ripped it from
the shelves.
14 Buying an AR8000 will allow you many opportunities to
go back to AOR or an OEM to replace the BNC connector,
knobs that fall off and lettering that wears off. Too
bad they don't make an OEM case, preferably with
racing strips, to replace the cheap one it comes in.

> I could go on like this for hours.> If you can not afford both then the 235xlt is the far
> better choice for any one buying any kind of scanner
> radio in todays market. IMHO. Like a woman's limited

I won't even touch this!

> One then can add some of the
> functions that the AR8k does by buying an inexpensive
> ($200+) all band shortwave like a small Grundig or Sony.

I think even the middle-of-the-line Grundig and Sony
would eat the AR8000 for lunch when it comes to shortwave.
Just like it would for every other HF/VHF/UHF receiver.

> Be happy with whatever choice you make in monitoring

Excellent advice Dave. I will also mention, that in today's
age of computers, many services are available via phone with
digitally synthesized voices.
My charts for Kennedy indicate ATIS by calling 995-8188.
Similarly, La Guardia, lists 478-6070(Arrival) and 478-
6118(Departure). I would assume both will give you current
conditions at both airports as well as runways currently in
use.
Good luck!

Hello,

I've been considering purchasing a Uniden BC-12, but I have a few questions. First off, does it live up to the marketing? What I mean by this is, does it actually give enough advanced warning about officers ahead? I've heard a lot of mixed reviews about the BC-7 & BC-10, but there hasn't been much discussion (or that I've seen) on the BC-12. The reason I ask is that scanners are illegal to carry in the car in Michigan and if I'm going to take the risk, I'd rather know ahead of time what the unit's limitations are. Also, if you know of any dealers that give a fair price, that information will be put to use and credit will be given where due.

I appreciate any information!

That is up to you. We are not going to promise anyone
that the list might
not get caught in a mail loop and sent out hundreds of
the same message to
each subscribers email account. We are far enough along
in our testing that
we believe we are pretty stable. But you just never, ever
know...

We do ask that non staff do not post traffic to the list
until we are done
with our admin and testing functions. The traffic will be
boring for a while
longer.

Have a great day,

I agree that DL's LAX facilities are pretty good even though LAX is a miserable airport. I wouldn't classify LAX as a DL hub. It was when DL originally aquired Western Airlines but the only hub connections left are a few Southern Cal. Skywest connections and a few flights to Hawaii..

Most of DL's west coast operations are "hubbed" thru SLC (Domestic) or PDX (APAC).

I've always thought DL could make SLC a true international and transcontinental hub but they haven't done so yet.

In the 20's, 30's and 40's, glossy black boots that went up to mid-calf
or so were very popular with authoritive types (military and police)
because they gave a very spiffy look to their uniforms. Unfortunately,
in many cases, they seemed to impart a certain, um, enthusiasm for the
job to some who wore them. They were called Jack Boots (I don't know
what the name means). If you look at contemporary illustrations of
Hitler and his cronies, they are quite often seen wearing these boots.
Americans never seemed to catch the craze.

ki4je@Xbellsouth.net (Victor Healey) writes:
>
>
>>
> Look at the price of each.

AOR's cost a mortgage on your doghouse.

The fact that they both exist gives people with
more money an advantage. IF you can afford to
spend what the AOR will cost and the other AR does
cost, then that is your satisfaction.

It is obvious that the Ar one is far superior...but
at how much money spent? MONEY is the factor.

As for the female thing...them being less advanced in IQ
than the male will not really win too many votes on
your approach to the "being female" in america.

I don't know...what is a man's job? How do you get it to
mean much in light of the fact that women do things not like
men do. so then that must be a woman's job. A woman does it
unlike a man. That would be a more "realistic" statement.

And her LIMITED Capabilities...gosh, your mother really must
be one dumb female. So limited in her ability to bring you
into the world able to see what is seeable....

Making women out to be to your imagined image in this imagery
is not part of the solution. It has nothing to do with the
issue you began with. And to state it that fundamentally we
are alike but obvious differentials: wrong.

the only difference is in the pelvic bone, rib-count and
x and y chromosomes. What you got women have too. Just
that it's hidden. Your balls she has a uterus. Your cock
she has a clit. It's inverted.

The main difference really is in the brain: she has two
thinking centers and we have one. That is the big and main
difference that is addressable. She is born into a body
and she dies and becomes dust. Men are born into a body
and when man dies becomes dust.

So the brain seems to be the main bane with you. You are
not too happy with what your dumb-motha did for you. so
she's less .... what a way to think of your momma....

bill conduit
etc.

women deserve a lot more credit than man gives them.

Does "professionally modified" mean something different than having the
diodes cut for a high price? ;-)

not that I'm an expert in these matters, but I don't think it is. There are no Moto type control channels, instead they have some sort of system where the repeaters seem to be always open (i.e. white noise) and then just when you get mad and go to resume scanning, someone begins talking. Anyone know what this is I'm describing?

Oooooh. Who do you think Lo-Jack gives their receivers to, asshole, the
drug addicts? I guess that this would make the cooperative recovery
rate close to 100%.

Maybe you would rather get a receiver and try it yourself, without blue
(or red) lights, siren, guns, handcuffs, etc.?

The Blue Angels are in town for an airshow. What frequencies
do they use these days for communication?

Please respond via e-mail, I don't get to spend much
time with news these days.

Thanks!

Regards, Mark.

mrg1std@aol.com (MrG1stD) writes:
>I am going to be buying a hand-held GPS(Non-Aviation Unit) and am looking
>for any recommandations.

If you are going to be using the unit in trees, or in downtown urban areas (high buildings), you should get one of the newer parallel-channel receiver designs. Their performance is *far* better than the old multiplexing receivers in difficult conditions. Models worth looking at:

Eagle: Explorer, Expedition, Accunav
Lowrance: Global Nav 200
Garmin: 12, 12XL, II+

All of these are relatively low-cost handhelds. If you are willing to spend about twice as much, there are GPSes with built-in surface maps.

On the other hand, if you will only use your GPS on water, or in the desert or prairies (no obstructions), one of the previous-generation multiplexing receivers will work fine, and you should be able to find one used for a low price (because lots of people are selling them to buy one of the better receivers above). Models in this class are:

Garmin: 38, 40, 45, 45XL
Magellan: 2000, 3000, 4000

The Magellan 2000 has no DGPS or computer interface capability; all of the others do. I would not recommend the new Magellan 2000/3000/4000 XL models - they are new, so unlikely to be found used, yet have the same old lower-performance receiver as the older models.

Look in sci.geo.satellite-nav for reviews and comparisons of various models.

>web site next.

If you actually *read* the info on the QRZ web site for half an hour or
so, you'd see that their listings for hams in the USA comes directly
from the FCC. But their data for foreign hams is not automatically
updated. I'm listed in QRZ, because I supplied the data *myself*.
I could have supplied bogus data, too - there is no indication that
the data for non-US hams is checked.

On the other hand, if you checked the site that does have a proper
Canadian call database (http://www.aras-sara.ca/arasbook.htm), you
would find VE7JPN listed.

The US is not the world. QRZ does not list the world. Finding things
is what search engines are for.

The best scanner antenna I have found (and I've tried many) is the
NIL-JON scanner antenna (They make ham antennas too). It covers 25 mhz
through 1300 mhz very well! It looks like a beam antenna, but it's an
omnidirectional antenna and it's built to last many years. I highly
recomend it. check out the NIL-JON antenna line at:
www.dynamall.com/nil-jon

Happy Scanning!

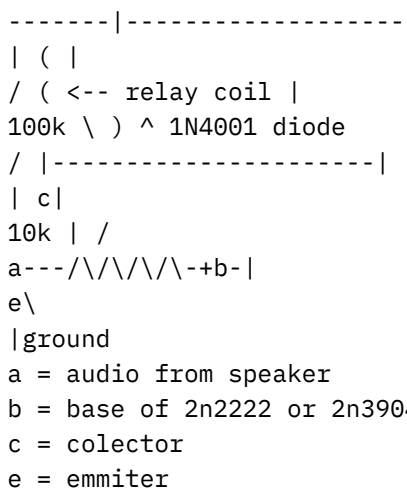
Bill Cheeks scanner mod book 1 has a circuit and how to connect to a PRO-200? series scanner, your right, a transistor and relay but you have to know where to connect it. It connected to the squelch trigger on an IC. I don't remember what chip it was now.

You could use the audio to trigger it but the gain of the transistor would have to be high enough.



a = audio from speaker
b = base of 2n2222 or 2n3904
c = colector
e = emmiter

The 1N4001 is a clamp to keep hi-voltage spikes from killing the transistor when you turn the coil on/off.

You might have to "Play" with the resistor values, it should work..

Also try a darlington if you can't get enough gain from the standard device.

Good luck!!!!

Give it a rest. Here in San Diego we had a widely-publicized
raid-run-amok in which a innocent (and locally respected) man was
terrorized in his own home. Of course a warrant was issued. The
problem was that the informant gave the feds bogus information that
was never checked prior to the raid. And no, I didn't witness it
personally, I read about it day after day after day in the local rag.
Nothing was ever disputed by the feds. They just blew it in their
over-zealous approach.

If you think that this bs doesn't happen regularly, perhaps you need
to have it happen to you personally.

If you can't hear the tower, you won't know for sure. The next best options, in order of value would be 1) approach control, 2) ATIS, 3)check the wind direction. I might also add that if you do listen on the tower freq, most pilots will read back the runway clearance and you will probably be able to hear that.

>Some nut
> walks into McDonnald's and starts shooting up the place. How can the
> police protect me at that moment when I am in danger? By the time they
> get there, he's gone and we're dead.

Well, this happened in Little Rock, and the officer, who was there eating
attempted to apprehend the suspect, but got jumped by an accomplice
that had been sitting in a booth watching for police. The officer is now
dead, but the public was spared... Also, I believe the police did a
pretty good job in that LA bank robbery. Again, no civilian deaths. The
key is to have an immediate way to alert police (alarm co with an
audio monitor and a direct line to dispatch), and a police force that is
not so bogged down by BS complaints that they have enough available
units to GET THERE while the crime is still going down.

> Police pick up the pieces and **possibly** prevent the perp from doing
> it to someone else. But it's too late for me. When I need _immediate_
> protection the only person I can _really_ count on is me. No disrespect
> meant, just the a fact of life. Am I wrong?

Actually, I think the crime rate would be considerably higher if the police
were not on the streets. While they cant be in your home protecting you,
just the fact they are out there is probably decreasing the likelihood of
your
being a victim. When people realise the police are not marriage
counsellors
or brokers in civil disputes, there will be many more police available to
prevent crime.

-not a cop-

4149. Finding Trunk Tracker I-Ds

Newsgroup: rec.radio.scanner
Date: 1997-06-10 00:00:00 UTC
From: jeffmulter@aol.com
Message-ID: <19970610215000.RAA10687@ladder02.news.aol.com>
Source record: 194878

For those searching for type II system I-Ds with the Trunk Tracker, note that common talk groups are often spaced 32 digits apart, if going by the digits displayed on the Trunk Tracker.

For instance, if you've identified a "fire ops 1" channel displaying 8624, it's likely that "fire ops 2" - if there is one - is at 8656.

I presume this has something to do with the way Greg Knox wrote the code for Uniden, and how it converts the hex code to fit the TT display.

In the near future, I hope to have the time post the I-Ds for the Charlotte - Mecklenberg County, NC type II system. I have more than 50 talk groups I-Ded, and you'll be able to see the pattern on 32-digit spacing among the police, EMS and fire modes.

Any comments or corrections are appreciated. Any Charlotte area readers ... feel free to e-mail. Please use the e-mail address of <JAMULTER@aol.com> after June 20th.

Jeff Multer, Charlotte, NC

Here is a short one:

I kept telling my dad that I was going to get a TrunkTracker, and how it would make listening to the 800 systems here in Columbus much easier. Every time I told him, he would get this funny look on his face, but he never said anything. One day, shortly before it arrived, he asked how big it was. I though that that was an odd question to ask. When I told him it was about the size of an HT, he got this look of understanding.

All the time, he had thought that it would be delivered on a freight truck, and would have to be installed in the trunk of my car (ala the name _Trunk_Tracker). Thought is was some kind of big tracking device that had to be put into the trunk.

Oh well, guess you had to be there--it was funny, believe me.

I can't believe I'm doing this but here it goes...
Masa, just shut the hell up and learn something from this group. I
admire folks who ask various questions in this group from "what is
trunking?" to "what are the cordless phone freqs?" Do you notice how
most folks let the area experts answers these instead of spouting off?

Why not give your POST TO NEWSGROUP icon a break, for all our sakes.

Radio range is a log function, not linear. 4 watts is 6db stronger than
1 watt. 1 watt into a +6db antenna is the same as 4 watts into a unity
gain antenna. Distance is relative and greatly dependent on several
factors (feedline losses, TX VSWR, ducting/refraction/prop, antenna
orientation, rf absorbtion of your head, etc).

It happened just about 4 months ago in a suburb of St. Louis. The goons broke down the door of a house and threatened the occupants, yelling and cursing at them. Turns out they had no reason to do so. Their informant was unreliable and had a grudge against the family. The raid was performed before the facts were checked. Elsewhere, a man named John Lawmaster was the recipient of an ATF raid. They found nothing, but left his house a wreck, a total mess. They left his gun lockers open and unsecured, and his front door wouldn't shut and lock. In Oregon, a woman was held prisoner in her basement for 6 hours without being able to call a lawyer. The goons trashed her home business (a beauty salon) and terrorized her kids. The goons told her neighbors that the woman was a wanted felon. Ooops! A case of mistaken identity, and the mistakes were obvious. The Portland police told the woman she should get a good lawyer and sue them. In Maryland, a restaurant was raided by IRS thugs. Forks were forcibly removed from customers' hands and the booths were trashed. The owner had a watch confiscated from him (never returned). The informant was a former employee who was fired after embezzling $30,000. She told the IRS and DEA that there was cocaine piled to the ceiling and that there were Jamaican gangs there. Again, nothing was checked before the stormtroopers charged in. In this case, the owners and employees are suing the agents themselves (not the immune government) for about $20 million. I hope they win. Cases like these happen EVERY DAY. The government has gone crazy with forfeiture raids.

You could be next. Have a nice day.

Again, nothing was checked before the stormtroopers charged in. In this case, the owners and employees are suing the agents themselves (not the immune government) for about $20 million. I hope they win. Cases like these happen EVERY DAY. The government has gone crazy with forfeiture raids."

As you cite no sources I can only assume you personally witnessed each and every case cited, and that you have extensively interviewed both the civilians and the agents involved to determine the truth. Remember, none of these actions could have taken place without a judicial order. You might want to obtain a copy of the search warrant in each case to see on what basis that order was issued.
Understand, I'm not disputing your version of these events, as I have no knowledge of them whatsoever. I just hope that your recitation is based on fact and not "common knowledge."

John

my favorite Delta hub is LAX. Terminal 5 is nice, like the connector tunnel to t-4, t-5, t-6, and t-7 also...DL does operate electric cart svc in the tunnel btwn 5 and 6 during the day when it's busy.
the crown room in T-5 is nice also, it's upstairs above the Burger King.

Delta has their own ramp tower at LAX for traffic into and out of the gate areas..this tower also supports some traffic at T-6 and T-4. They can be heard on 131.45, Delta's "company Frequency at LAX is 130.1, for maintenance, they use 460.75. DL hads also used a trunked 800mhz system at LAX.

I usually take a scanner with me..can monitor, operations, the company channel, maintenance, or the ground, tower, tracon, or center traffic.

once was at LAX during a thunderstorm..the lights in the terminal went out briefly..about 5 minutes before the backup power kicked in...

Hello My name is Don Ham Radio operator KA9QJG the answer is yes in states that make it illegal to have a handheld of mobile scanner you can and will be arrested I was arrested in 1992 and 1992 in Hammond Ind for having a scanner and a crystal controlled 1 freq mot on a ham freq car was towed equipment was taken and damaged and I set in jail untill I was able to get up 1000 dollars to bail out I had my ham radio lic and state issued ham plates on my car ham radio operators are one of the exemptions of the so called IND SCANNER LAW so after spending thousands on lawyers and various other bill I was found not guilty I have filed two lawsuits against the city for violation of my civil rights and fales arrest.Example if your wife etc went to the local radio shack and bought you a scanner for your birthday and its a handheld or a unit that can be put in the car as soon as they walk out the dorr it is no longer a scanner but now becomes a PORTABLE POLICE RADIO and they can be arrested so good luck to all scanner users

> carrier.
> I have no idea of whether this is legal.

I'd assume they would have to ID every .25 hour, *if* they were "legal".

Isn't there a regulation about timeouts? Thirteen minutes or something like
that?

He may be receiving "birdies", or even intermod from a TV station. The AM
rejection of a FM receiver will make a AM signal sound like a dead carrier,
even though it is modulated (listen carefully to those "dead" carriers).

Most of the time it is RF interference from computers, fax machines,
digital answering machines, newer TV's & stereos, or anything with a high
speed processor clock. Most things these days do not really completely turn
off. Noise sources can hide in very unsuspecting places, even telephones
and battery chargers. Anything with a processor is suspect.

Program the frequency into a portable and run around the house and see if
the signal strength changes.

Source record: 194926

Remember when I posted a request for information about a frequency that was a puzzle to me?

166.0 MHz broadcasting with a PL tone of 131.8 Hz. No voice comms. Data burst only every ten minutes on the nose.

I only heard it for several hours one day. It hasn't been back. My frequency guides say the frequency belongs to the IRS Criminal Investigation Division but the IRS doesn't use that PL tone in this area, the US Army Corps of Engineers out of Benbrook does. Since there is a reservoir at Benbrook I thought maybe it was some sort of telemetry I was hearing.

Well, it turned out to be IRS CID afterall. The day after I stopped hearing the data bursts on the frequency, the DEA, INS, and IRS CID conducted a massive drug bust involving Mexican nationals.

FOR SALE: UNIDEN MR-8100A mobile scanner. These units were designed for the California Highway Patrol and were sold in limited quantities a few years ago. They cover up to 1 GHz (including CMT) and are programmable from the front panel or by computer. There are 10 banks of 10 channels each and the display is alpha-numeric. The turbo scan mode is very fast.

This radio was never used mobile and thus is in near mint condition. It comes with the original mobile external speaker, programming software, scanner and software manuals, etc. Price is $300.00 plus UPS or other shipping method of the buyer's choice.

If interested please reply by e-mail.

> Ah, nice to be young! The 8000 has 1000 frequency possibilities in 20
> banks as opposed to the 300 frequency and 10 bank "limitation" of the
> 235. Although it's not full, I do lose track (no pun intended) from
> time-to-time.
>
>
Add to those virtues of the AR8000 verses the trunktraker
25xlt.
1 The AR8k has decent audio even without and
external speaker.
2 The AR8k will not lose its extensive programing
within three days of a power failure like the
25xlt will. That is why they give you two
batteries with the trunktracker!
3 When searching you can have the AR8k store the
found frequencies automatically with an alpha tag
automatically created for you.
4 The AR8k can run off of the power in a mobile
vechile while scanning a clear advantage on a
trip.
5 The AR8k can recharge its batteries while
scanning mobile.
6 The AR8k has signal strenth meter that is very
helpful in indicating exactly how close you are to
lossing a the system you are monitoring.
7 The AR8k's search functions can be linked to
give you up to 1000 pass frequencies when
searching for an elusive 800 mhz frequency.
8 The AR8k can search for you while you eat dinner
and find all the active frequencies in an area if
you are clever enough.
9 The AR8k covers an amazing portion of the radio
spectrum for a handheld.
10 The AR8k is one of the few scanners that can
track the military frequencies. This is important
to a milcom monitor.
11 Many mods to improve the quality or add more
functionality to the popular AR8k are available.
12 The AR8k can land you in jail if you tape a
politican's phone calls. I would never tape my
congressman Newt Gingrich for that reason! The

235xlt doesn't even offer you that option to break
the law and become famous for fifteen minutes.

I could go on like this for hours. There is no comparison
betwen the two. The BC235xlt does one thing very well. It
can read and decode the the talk groups in a trunking
system and then follow them more or less. That means if
you want to follow talkgroups then you need a 2335xlt in
your inventory since that is the only cheap radio that
can do that. IMHO the 235xlt is an important development
in radio monitoring and to waste time dwelling on what
hardware features the 235xlt does not have will not
accomplish very much other then to make one unhappy.
Perhaps Bill Cheek will get another couple of years out
of his scanner book by making mods to the 235 xlt to make
it more like an AR8k type radio. I doubt that he can with
the new surface mount parts and such, this stuff is just
getting too tiny to easily work with for the average
person.

I bet AOR will have a scanner eventually that follows
trunking and has similar or better features then the
Ar8K.

When comparing the two radios think of a man and a woman.
They both are esentialy pretty much the same with a few
notable differences. You therefore do not send a man to
do a womans job. You don't need an AR8k to do the job the
235xlt was designed to do. You need both!

If you can not afford both then the 235xlt is the far
better choice for any one buying any kind of scanner
radio in todays market. IMHO. Like a woman's limited
capabilites it isn't perfect for all types of monitoring
functions but it will do. One then can add some of the
functions that the AR8k does by buying an inexpensive
($200+) all band shortwave like a small Grundig or Sony.
Be happy with whatever choice you make in monitoring
radio traffic.

Don't forget the elderly black minister in Florida (a case of a bad informant), the J.B.T's broke the door down to his house, trashed the place, and he died of a heart attack in the process.

Think about it, the word of criminal informants is being given more credibility that that of law abiding citizens. The U.S.S.A is on the fast track to you know where...

Welcome to Amerika in the 90's, a Kinder, Gentler Gestapo...

Awfull defensive aren't you? Yes police do a lot, BUT they are not the
great protector that you may think you are. I'm not down on cops. My
father is a retired cop. I know what it's like when your father is late
coming home from work and everytime the phone rings, you think, "is
this "the call?". So don't get holier-than-thou with me.

What bothers me are police that let it go to their heads, (and think that they are better than _everyone_ else). Tell me you don't know anyone like that.

Police keep civil order. Individual protection, well that's another story. Someone breaks into my home and threatens my family. How can the police protect me at that moment when _my_ family is in danger? By the time they get there, he's gone and we're dead. I get mugged on the street, how can the police prothect me at that moment when I am in danger? By the time they get there, he's gone and I'm dead. Some nut walks into McDonnald's and starts shooting up the place. How can the police protect me at that moment when I am in danger? By the time they get there, he's gone and we're dead. Examples are endless, but I think you get my point.

Police pick up the pieces and **possibly** prevent the perp from doing it to someone else. But it's too late for me. When I need _immediate_ protection the only person I can _really_ count on is me. No disrespect meant, just the a fact of life. Am I wrong?

Bobby

Well, Sky King, turn on your HF rig and listen. The U.S. Coast Guard is not the government/military for the entire world. Morse code is still being used by plenty of governments and the military in countries that you don't happen to live in. While you are correct in saying that Eric doesn't have his ducks all in a row, apparantly you don't either.

There are a lot of Frequencies in Police Call from Radio Shack.
Here is a few I have in my scanner. (From Fresno,CA)

Ch 1 460.050 Fresno PD South West
Ch 2 460.325 " " Central or Unit-to-Unit
Ch 3 460.275 " " South East
Ch 4 460.400 " " North East
Ch 5 460.475 " " North West (My Area)
Ch 6 460.250 " " Tac. or Unit-to-Uni
Ch 7 ?????
Ch 8 460.025 " " Multi Agency
Ch 9 460.425

460.175 Clovis PD
460. 225 Clovis PD

464.875 Community Hospital Security
462.100 Kaiser Hospital Security

Fresno Air Terminal (Fresno Yosemite International)

118.200 Tower
132.350 Approach/Depart
119.600 Approach/Depart
121.700 Ground

153.875 Fresno Fire Dept (Dispatch)
154.310
154.190
154.280
154.365

I have approx. 15 frequencies for Fresno County Sheriff. Let
me know if you want them. These and the above frequencies are the
main ones I have in my scanner (Pro-51). If you are interested in
something else, I will try to locate it for you.

A little touchy, aren't we? The teenagers who work in the RS stores around here couldn't tell you the difference between a HAM radio and a scanner. Not to mention the extremely limited selection. Last time I looked, there were 3 handheld CB's, maybe 3-4 mobile models, 2 HAM hadhelds (a 2M and a dual band), and maybe one type of mic to buy. The dedicated radio shops at least provide the opportunity to compare between brands and features. Much larger selection.

For the most part, I have found RS scanners to be a fairly good quality and have owned two over the years, but beyond selling the radios themselves, very little in the way of accessories.

Just out of interest, what kind of uses would you have for a GPS in your car?
I must admit that I love electronic toys and GPS ranks up there, but I have
yet to find a usefull purpose for it other than outdoorsman. Good for hiking,
fishing (marking spots), boating, etc. Any day to day uses?

The list of CB Shops is finally available for your shopping & repair
needs
all over the nation.
CB Shops listed from East to West and North to South are available
and
ready to address your needs. Some carry hard to find equipment, and

some carry wholesale parts & equipment.
Whether it's a brand new radio or an old tube type amplifier, your
chances
of finding what you need are much greater and faster with this
brochure.

This brochure is LOADED WITH OVER 50 names, addresses,
and telephone # 's of
different shops, shacks, and even, shops on wheels.

This brochure will pay for itself with the time it will save you
in searching
for that one shop that can accommodate your specific needs.

Here's how to get your copy of this, fast selling ,
brochure.....

Send $2.00 cash, .32cent stamp , and of course, your snail mail
address
to.....
(please include your e-mail address)

I have come into possesion of an AOR AR800 (not the AR8000). The scanner is not working, and I feel that the battery is probably dead. It appears to be an internal battery--has anyone had experience in changing the battery or could give me some idea how it can be done? I would prefer doing it myself instead of having a tech do it, if at all possible. Thanks for any help.

The RS ground plane antenna has no gain either. Only an antenna
labeled 5/8 wave or collinear will provide any gain (3db and 5db +/-)
in the above cases. There are no omnidirectional antennas I know
of that cover ALL the scanner frequencies that provide gain. There
are yagi type antenns that do, and one/two/three band ham antennas
that will. Its my guess from listening on the radio shack antennas
vs a home brew discone (solid disc, screen cone) that the DJ1300
would probably be much better for 800 MHz, and probably better for
all the bands, considering its low swr across its range.

To hear travis from 60 miles away, you will probably need a high gain
beam (yagi or home brew quad) covering the frequency range they
use, unless you are lucky enough to be on top of a real high hill.
If you can get them now, using the DJ1300, but weakly, then
switching your coax from RG58 to RG213 or semi-hardline will
probably do the trick.

4212. Re: FRANK BURNS: THE IDIOT IS FROM PHOENIX!

Newsgroup: rec.radio.scanner
Date: 1997-06-11 00:00:00 UTC
From: hlkingston@aol.com
Message-ID: <19970611030300.XAA13303@ladder02.news.aol.com>
Source record: 194778

Eric,
Let me begin by reminding you who started this flaming session--it was YOU, sir. I posted the address to a Web page, and because you saw the name HLKINGSTON on the post, you had to respond with your inane, meaningless commentary, as you do with all of my posts in rec.radio.cb and rec.radio.scanner.
Why is it that I can NEVER post anything without you putting in your two cents worth, Eric? Does just seeing the name HLKINGSTON wind you up so much that you absolutely MUST respond? How do you know that there aren't any members of rec.radio.scanner or rec.radio.cb interested in hearing some waves of Frank Burns or Howard Lance Kingston? Have you been keeping track of the number of visitors that <http://members.aol.com/RazzU/QuietOne.html> has had since the page's address was first published last week? Your "know-it-all" attitude is typical of many dorky Technician class amateurs who are transplanted 11 meter operators that left the Citizen's Band because they couldn't even get the truckers on 19 to talk to them because they are such crashing bores! I hear you dorks on the local 2 meter repeaters all the time, spouting what you believe to be your vast technical knowledge, when in fact at least half of the statements you make regarding radio theory are incorrect! Don't take yourself so seriously, Eric--you're just a Tech. class license holder. The FCC has made it so easy to get a no-code Technician license that even a five-year-old can pass the exam!
As far as my information about Frank Burns is concerned, I think you need to listen to 27.365 MHz LSB more often. There is an operator on that frequency which keeps insisting that the amateurs in the Phoenix area have told Mr. Burns that he is no longer welcome on 2 meters and 6 meters. I was merely repeating what I heard on 27.365 MHz LSB last Saturday (June 7). If there is an 11 meter operator in Phoenix giving out false information about Frank Burns, I will leave it to you to correct that operator, since you seem to think you have all the facts concerning Franky's presence on the amateur bands.
Your ignorance has been well documented in rec.radio.scanner as well as other newsgroups, Eric. Several weeks ago you were roundly criticized for falsely accusing an AOL member of blackmail, and more recently you have been told that the reason you couldn't find a Canadian amateur's callsign in the QRZ database is because the QRZ database only lists United States callsigns. Therefore, I believe you are not in any position to accuse me of not having my facts straight before I post a message.

>I can always use my brain to remember the more important codes

I have to agree...

I had an AR8000, and once getting past all the bells and whistles, it
was the MOST annoying scanner I ever owned, and I wound up selling
it....

Spent hours programming it via computer, had the birdie and clipping
mods done, and as a receiver, I thought it SUCKED......

sensitive...yes, to a fault. could not scan banks without it
constantly stopping on quick squelch breaks for no apparent reason,
intermod, and other interference made it intolerable to listen to in
my area...NY Metro..

Can't beat the HS 200 from RELM with PL tones.....and this Trunk
tracker seems nice and tight, and WILL follow this trunking stuff,
although it takes a bit getting used to...

This is one of the things that Darryl Gates warned about. However, too
many administrations are too afraid that the public is going to be
pissed that the cops aren't coming out to decide how much of the tree
branches the neighbor can cut or to light the gas furnace.

: in the tunnel btwn 5 and 6 during the day when it's busy.
: the crown room in T-5 is nice also, it's upstairs above the Burger King.

While DL does have a nice facility at LAX, my favorite Delta hub is CVG. It is nicely spread out, clean, and efficient. Rarely do I encounter any delays unless they are weather related. Weather related delays at CVG are rare, but the 2 most often problems I have encountered is fog, which just slows down operations, and de-iciing - I once had to sit on a DL MD-80 for two hours to get de-iced for a 1 hour flight, but it was during an unexpected ice storm - and the drive to CVG that morning was extremely dangerous as well - I recall sliding several times on overpasses on I71/I75 driving to the airport from Lexington.

This frequency (actually 450.2125) is used by broadcast stations to (amoung other things) relay remote programs back to studio.

As I recall, most noise sources add an AM to the signal. FM
discriminators aren't very sensitive to amplitude changes in the
signal. In addition, I think the FM signal is usually clipped in the
receiver to remove most AM modulation.

Dan,

I agree with you whole-heartedly....

I continued to be dismayed by Uniden's pig=headed insistance on
designing these awkward battery systems in their scanners, when they
solicited feedback from scanner hobbyists in the past, and one of the
BIGGEST complaints was the battery packs.

Very simply....4 AA batteries would've been more logical, easier to
use, and cheaper for the consumer....Period.

(Remove "X" to write to me)

I have an Opto Scout with DB25 (Grove ANT 27 1.5"?) antenna.

Can anyone suggest an antenna or filter that would make the
Scout deaf in the 824-849MHz Cellular Handheld range
while enhancing 130-150MHz and 410-460MHz ranges?

I'm tired of logging cell-addicts when I really want
the person keying up their 410MHz radio just a few
feet away.

>Xmiweber@davidson.eduX -- without the X's
The scout works great. I have had mine for just over a year now and love it.
Yesterday I took it to a Business fire and it decoded 60 frequencies. Most
were 800 mhz cell but some were usefull such as the 450 mhz news reporter and
the 450 mhz power supply frequency. I recommend buying from Opto directly.
If you have the ar8000 then this is a must buy. Reaction tuning is the best.
Nothing like driving down the road hearing that beep beep to show a hit has
been made then seeing the person next to you on the cell or microphone.

I live in Michigan and a couple years back I was pulled over by the police for a traffic violation. I had a portable scanner on my front seat. The officer confiscated the scanner, arrested me and took me to the police station where I had to post $100 bond before I was released. When I went to court I pleaded guilty to both the traffic violation and for having the scanner. The judge asked me if I knew it was illegal to have a scanner in my car. I lied and said I did not know it was illegal. He said that most people probably do not know that it is illegal, then found accepted my guilty plea and suspended any fines for the infraction and sent me on my way. I still carry a scanner in my car but now keep it out of sight.

some one published a list of all the tv station's addresses.
about four or five months ago in one of the pro publications.

didn't pay much attention to it...so it could be any of them.

why not go into the search engines and try looking for

radio stations
television stations

see what pops up

Why did you plead guilty to this ? I would have taken it to US Supreme COurt if I had to. FCC has already stated that "no state or local gov't entity can make such laws regarding communications regulations." Pleading guilty and shutting up is just what makes the system get worse. Fight like hell!

I have to wonder about this one. As an amateur radio license holder, and a Part 90 License holder for itenerant fregs on bith VHF and UHF, if I am pulled over in Michigan with my Motorola Spectra in scan, and happen to have UHF Police freqs in it, then what? Is the stupid law very specific on "scanner radio" only, or can anything "capable" of receiving the secret police be confiscated.

I know many years ago there was a lawsuit filed by a ham for a violation of an anti-radar law in his state. He argued, that a radar detector was simply an amateur radio receiver capable of receiving amateur radio spectrum. (most radar is in shared spectrum). He won. So what about a new Yacomwood mobile with the 50-512 and 800-960 receivers in them?

Wonder if anyone in these police states have an answer.

Tom

In Michigan is illegal to have a "device capable of recieving communications designated by the FCC for police use". Unless you are a bona fide peace officer, OR an amateur radio op. with a Tech class license or higher! Technically this could be used against you if you have a pager that is "capable" of being tuned to police frequencies.
Don't think that all cops know the law, or you are an amateur and you can flaunt it. I was stopped by our city police, they called in a back-up unit, and then called in a supervisor (for a total of 3 cars!) They took me and my friend (also an amateur) put us prone on the back of my car, and told me to take the radios out, I refused, showed them a copy of the law (I carry 10 copies in the glove box!) and explained how it worked... WRONG! They explained how they work, they are "paid to know and enforce the law" and that "we were stupid" and better shut up - they said that they were "doing US? a favor by not taking us to jail!" HA HA HA!
Thinking that the Supervisor would come to his senses... I don't think so, he took a knife out of his pocket, cut all of my wires to my radios, including my remote mount amateur unit, all my handhelds (amateur), plus a speed dial list for our repeater. Told us to have a good day, and go away! After contacting his supervisor, who was smarter than him, he realized that they made a MAJOR mistake and started to kiss ass! Took about 4 weeks to have everything re-installed.
So if you have a reciever in Michigan, you better be carefull!!! State Police will get you big, and so will the smaller depts. Keep in mind, according to the law - not even firefighters, paramedics, wrecker drivers etc. can have one in the car.
SO BE CAREFULL!!!!

I personally would never suggest that a cop leave their gones in the vehicles. What is a cop with out their gones. I personally will give up my gones whenever someone explains what the hell a gone is.

OK I know you meant gun. Just trying to lighten up the subject.
The truth is, sometimes even cops make mistakes. It is best to stay on the right side of the law. That way you won't be staring down the barrel of an officers gun at 2 am.
If you live in some quiet little suburb, you don't have a clue as to what kind of animals live in the ruffer side of town. So quit bad mouthing the cops and get on your elected Representatives to pass tougher punishments.
Now lets talk scanners again.

I would like to set up a two-way radio network of about 50 miles.
I would like to incorporate portables, mobiles, and base sets.
I could position a repeater on the highest mountain in the area.

1. Will GMRS radios work?
2. Could the repeater be run from batteries and solar panels?

If anyone has this type of system already I would like to hear about it.
Any suggestions wold be appreciated.

The Supreme Court has also said that the states have the right to make regulations regarding proper equipment for motor vehicles. The regulations prohibiting police receivers, provided they exempt ham operators in some way, are held to be a proper exercise of the states' police power. (This is why there are different state regulations regarding such things as pollution control and window tinting.)

The FCC does not have anything to do with this.
You need to address this problem to your state legislature or Congress.

Ok, can we drop this now? It seems some people need to get a life.
Could we also get off the code/no code stuff. If you never tried code,
don't knock it. If you can't pass it, don't sweat it. If you can pass
it, don't put down those who can't. Some people just have a need for
something to make them feel superior to others. Everyone wants to be
the best at something. There sure seems to be an abundance of thin
skinned people out there. It gets a little scary, doesn't it. If
someone asks a question you consider stupid don't get on their case,
just explain it to them. Everyone has questions and someone might
consider your question stupid. Why don't we all cut each other a little
slack? 73's N9KH

Metro West of La Grange Park, Illinois is selling alternative battery packs now for the Uniden BC235XLT Trunk Tracker. The radio is supplied with 2 smaller capacity ni-cd packs, which may last a few hours. Metro West sells a higher capacity ni-cd pack, and a very high capacity ni-mh (nickel metal hydride) pack.

The Metro West ni-cd pack is 950 maH and is $30 plus applicable tax and shipping, and the ni-mh is 1300 maH and costs $45 plus applicable tax and shipping.

These packs make nice high(er) capacity to the ni-cds that come with the radio. I do not have nor sell them; please send inquiries directly to Mike and Pat Huth of Metro West, 822 N. Spring, La Grange Park, Il. 60525; or call 708-354-2125 or 800-657-1475.

4271. RS2024 Info Needed

Newsgroup: rec.radio.scanner
Date: 1997-06-11 00:00:00 UTC
From: John Montalbano <jrmont@iquest.net>
Message-ID: <339F9823.644F@iquest.net>
Source record: 194837

Does anyone have a schematic on the 2024 from which they can determine a convenient spot to pick up the row and column signals from the keypad? Typically, this is at a connector, but apparently the keypad in this radio is wired directly to the main PC. I suspect there is a resistor or diode packe where these can be picked up. I am helping someone install a homebrewed computer interface and I am sure he would be very greatful for this info. Thanks. If you are interested, I will tell you where to find info on a neat little computer interface that you can build for about $12.00 in return for this info :-)

Selling BC220xlt 200 channel handheld scanner

Unit's in great shape, I've had it about three months from original owner.

I just don't have the time to use this unit, my interest is mostly mobile, not portable...

Asking $150 shipped, consider trades/partials for BCT-7, BCT-12, pro quality CB, or Mini-disc equipment.

E-mail questions or offers,

Joel

The SBE Optiscan was manufactured for Linear Systems by GRE, the
same company which made the famous Radio Shack PRO-2006.

The larger Sears model was licensed by SBE.

Despite the similarities, they use different cards and support
a different number of channels.

Miltary Affiliated Radio Service.

MARS was also used by soldiers in the gulf war. Used it myself several
times - but the phone was always easier <g>.

If your the Webmaster of a radio scanner web page then you need to check out:

http://www.geocities.com/CapeCanaveral/Lab/1060/scnrng.htm

This is the Radio Scanner Web Ring Page.

This is a new concept in linking the many pages on the Internet related to radio scanner use.

With this new system you will be able to get to any scanner related web site in the ring, even if the site goes dark. Get a list/index of scanner related sites. No more searching endlessly at AltaVista, WebCrawler, Yahoo etc. without success!

Add your site to the queue to be added to the Radio Scanner WebRing today. Just drop by the URL above, and fill the form out. (Webmasters Only, please!)

Get more hits/visitors to your page today!

Want more information on WebRing? Check out the URL below, for complete details:

http://www.webring.net

Does it work:

Check these stats:

Traffic over past 8 weeks: (6/12/97)

Author: JIM
Date: 6/12/97 8:40 AM
Subject: Fw: Watch what you say to a customer
------------------------------ Message Contents

THIS IS TRUE----PLEASE TAKE THE TIME TO READ IT AND PLEASE SEND
THIS TO
EVERY SINGLE PERSON YOU KNOW WHO HAS AN E-MAIL ADDRESS....THIS IS
REALLY
TERRIFIC.

My daughter & I had just finished a salad at Neiman-Marcus Cafe in
Dallas &
decided to have a small dessert. Because both of us are such cookie
lovers, we decided to try the "Neiman-Marcus Cookie." {EDITORIAL
COMMENT:
Neiman's is a VERY EXPENSIVE department store in the States}. It was
so
excellent that I asked if they would give me the recipe and the
waitress
said with a small frown, "I'm afraid not." Well, I said, would you
let
me buy the recipe? With a cute smile, she said, "Yes." I asked how
much,
and she responded, "Only two fifty, it's a great deal!" I said with
approval, just add it to my tab. Thirty days later, I received my VISA
statement from Neiman-Marcus and it was $285.00. I looked again and
I
remembered I had only spent $9.95 for two salads and about $20.00 for a
scarf. As I glanced at the bottom of the statement, it said, "Cookie
Recipe
- $250.00" That's outrageous!! I called Neiman's Accounting Dept. and
told
them the waitress said it was "two-fifty," which clearly does not mean
"two
hundred and fifty dollars" by any *POSSIBLE* interpretation of the
phrase.
Neiman-Marcus refused to budge. They would not refund my money,
because
according to them, "What the waitress told you is not our problem. You
have
already seen the recipe - we absolutely will not refund your money at
this
point." I explained to her the criminal statues which govern fraud in

Texas, I threatened to refer them to the Better Business Bureau and the State's Attorney General for engaging in fraud. I was basically told, "Do what you want, we don't give a crap, and we're not refunding your money."I waited, thinking of how I could get even, or even try and get any of my money back. I just said, "Okay, you folks got my $250, and now I'm going to have $250.00 worth of fun." I told her that I was going to see to it that every cookie lover in the United States with an e-mail account has a $250.00 cookie recipe from Neiman-Marcus...for free. She replied, "I wish you wouldn't do this." I said, "Well, you should have thought of that before you ripped me off," and slammed down the phone on her.

So here it is!!! Please, please, please pass it on to everyone you can possible think of. I paid $250 for this...I don't want Neiman-Marcus to *ever* get another penny off of this recipe....

(Recipe may be halved)
2 cups butter
>>> 4 cups flour
>>> 2 tsp. soda
>>> 2 cups sugar
>>> ** 5 cups blended oatmeal
>>> 24 oz. chocolate chips
>>> 2 cups brown sugar
>>> 1 tsp. salt
>>> 1 8 oz. Hershey Bar (grated)
>>> 4 eggs
>>> 2 tsp. baking powder
>>> 2 tsp. vanilla
>>> 3 cups chopped nuts (your choice)
>>>
Measure oatmeal and blend in a blender to a fine powder.
Cream the butter and both sugars. Add eggs and vanilla; mix together with flour, oatmeal, salt, baking powder, and soda. Add chocolate chips, Hershey Bar and nuts. Roll into balls and place two inches apart on a cookie sheet.
Bake for 10 minutes at 375 degrees. Makes 112 cookies.

4280. Aviation enthusiaist: What to look for in a scanner?

Newsgroup: rec.radio.scanner
Date: 1997-06-12 00:00:00 UTC
From: oopsbubu@aol.com
Message-ID: <19970612190600.PAA27715@ladder02.news.aol.com>
Source record: 194546

Hi,

I am an aviation enthusiast, and would love to be able to listen in to Air Traffic Control (ATC) at the DC area airports. I dropped into Radio Shack today, and they told me I needed a scanner that could scan "air" frequencies, and these were the more expensive scanners. I have seen scanner ATC frequencies range from the mid 100s to the mid 400s or higher -- so what is it that the "air" frequencies are buying me, that normal scanners do not have?

My question is: what should I then be looking for if I want to scan ATC? Radio Shack has several models that scan air, and the price range is very wide. What are the basics I need to know before I buy the scanner? This is very important, sicne Radio Shack does not accept returns on Scanners.

Thanks much,
Sam.

It was info gotten from a ham store...i asked
because I was curious about 400 trunked.

he said NO.

Look, i have asked the server to delete the post
early this a.m. After a few e-mails came to me
threatening to burn my psyche....

it won't erase. Not my fault. It seems to want
to remain.

I posted a correction.

so i have egg on my face. i'll survive.
so will you.

Sam,

First things first. If your Radio Shack doesn't accept returns on scanners then find a new store, 'cause I've never heard of an RS that doesn't honor their 30-day return policy on scanners.

Now, on to your main question. Civilian aircraft and ATC operate in the 108 to 136mHz band, in the AM mode. To listen to them your scanner must be able to tune frequencies in this range. The salesman was correct in that the cheapest scanners do not usually cover this range. You'll probably have to spend at least $150 to $200 (unless you catch a sale) for a new scanner with VHF airband.

Military aircraft, on the other hand, operate with ATC in the 225-400mHz range, also in the AM mode. Generally only the upper line scanners (Pro-26, for example) offer reception in this range. I think the Pro-60 and the Pro-64 do also, but I'm not certain. Military aircraft also operate in the 138 to 147mhz range, but in AM mode, not the NFM mode, which is how most scanners will tune this range. Again, it's usually the upper line scanners that will allow you to manually select AM mode in this range. Most of the comms in this range are air to air, and tactical, which is some of the most exciting listening.

There are also some military tactical comms in the 30 to 50mHz range, and these can be in any mode, AM, NFM or WFM. Again, you need a scanner that allows you to manually select modes. The Pro-26, a used Pro-43 or a Uniden 3000XLT are pretty good choices.

I hope this helps some, and if you have any other questions just drop me a note.

John

P.S. - If money is a major issue, Sporty's Pilot Shop in Batavia, Ohio, is selling a VHF/UHF airband only scanner for about $150.00. The only problem is that it only has 20 memory channels - not enough for the kind of monitoring you want to do, but probably OK for taking to an airshow.

Sam,

If you are interested in civilian and commercial aircraft, you will need a scanner
that covers 108 to 136 Mhz. If you want military aircraft, you will need a scanner
that will cover 225 to 406 Mhz (this is useful for airshows).

When I bought my first handheld, I did not realize that it did not cover military
aircraft. I called one Radio Shack and asked if I could trade it in (I had owned
it for 3 mos.). They refused to take it back if it was over one month old. I called
another RS and they said they would accept it as trade if I had all the original
packaging and the scanner was in good condition. To make the story short, I was able to trade up to a PRO-26 which had the coverage I wanted. I guess
it depends on who you take to.

4298. Paging decode software?

Newsgroup: rec.radio.scanner
Date: 1997-06-12 00:00:00 UTC
From: summitrt@aol.com
Message-ID: <19970612225001.SAA19208@ladder02.news.aol.com>
Source record: 194564

Does anyone know of a software that will decode Pocsag paging signals received by a scanner? Would prefer to see only pages to particular cap codes. I saw this at a trade show a few years ago but haven't seen it since. It was pretty cheap, only about $100.

Any help would be appreciated.

Bob

4299. Re: Eglin AFB Trunk Frequencies

Source record: 194565

Nope! You're the one who's got misconceptions. Federal agencies have trunked systems in the Military Land Mobile service (406-420 mhz). Most of the systems are Motorola, but a few GE/Ericson ones exist, too. The talk groups are made up of sets of ten frequencies, one being the control channel. Unlike public service trunks, the control channels does not change frequently, but usually remains on the low frequency in the group. You probably wouldn't be aware of these trunked systems unless you were an accomplished military scanning enthusiast or in a military position that deals with communications. The Army, AF, Marines, and Navy use these systems. Unfortunately we will have to wait a while for 'trunk trackers' to come out that support these military frequencies, but until then we can do the best we can with conventional scanners.

John

What makes you think trunk systems *have* to operate on 800 MHz? Why would the trunk system controller care (or even know) what band the repeaters it controls operate in? Here in Toronto, we have trunk systems in the 423 MHz, 800 MHz and 900 MHz bands. Ottawa has some in the 450 MHz band. I understand that in your country, the federal government operates trunking radio systems in the 406-420 MHz range.

I have a question people and listen hard because it's important
pleeeeeaaassseeee?
I have a scanner, well actually three of them, but only one of them
installed in my truck, it was a professional install, the bracket, the
whole bit. Anyways, it's a Radio Shack PRO-2026 100-Channel Mobile
Scanner, now here's the question.
A couple of weeks ago, I turned it on to monitor some cellular calls and
all my channels were erased, on top of that, when I pushed the WX (weather)
button, it showed 000000.00 across the board and the same thing with the
AIR channel. All the other (Fire, Police, etc.) are intact and frequencies
seem to be moving up and down well. Why the blank, did I blow a chip or
something? I did not try to enter any frequencies in the erased channels.
Somebody please help me?

If you buy it used BE REAL CAREFUL!!! If somebody butchered it putting it in or taking it out of there scanner you will pay for something that does NOT work.. If it was real cheap you could live with the risk..

Just my 2 cents..

Look at the discontinued PRO-60 for 200 bucks. It covers both the
108-136MHz civilian AIR and 225-399MHz military AIR bands, 200 channels
handheld. Normally overpriced at $379 but at $199 it's fair.
Basic coverage is 30-512 and 760-1000 without cell phone freqs.it also
covers TV audio and FM radio 88-108.

Well...people, I'm a rookie at this stuff but I do have a question and I don't care if my email get's flooded or not. Somebody with a scanner brain please help me. I'm trying to get the maximum results out of these scanners. Here they are:

I have a PRO-2026 100-Channel Mobile Programmable Scanner
I have a PRO-2036 200-Channel Home Scanner
I have a PRO-26 Portable 200-Channel Scanner with Continuous 25MHz to 1.3GHz Coverage.

What can I do with these?

Please email me at cskoenig@iglobal.net

ALL input would be greatly appreciated.

Clayster

I'm a TT novice here in Tacoma and have gotten the ValleyComm and King Cty PD, etc. freqs listed by Uniden for Federal Way input to one ban and those for Enumclaw in another - save one. There is room for 30 in a bank and 31 listed. Is there one or more of those that can be discarded and not lose any of the PD or Fire stuff? Any help in allocating just which frequencies might be "dedicated" to a particular service (if this is done at all) would be appreciated. Likewise, does nayone up here have talk groups, etc figured out? I have a few, but only ones others have likely figured out already. Glad to share and learn more.

I have done some trading with Ed Cox (from Indiana) if I remember right with no problems at all. I did not see the original post so I am not sure of the entire, original problem.

I have bought, sold and traded over the internet, GEnie, CompuServ, AOL et al for years with never 1 problem. I have literally done hundreds of deals with radios, telescopes, camera stuff etc. There are a bazillion honest people out there and evidently a few idiots. Ed in my deal was very honest, I traded him a couple of scanners for a Scout and everything arrived as promised when it was promised.

I just got home and noticed a blacked out LAPD cop sitting up the street double parked. I got home, turned on my scanner and found the freq. they are on. At this moment, on my pro-2006/diamond discone, I can hear about four cops talking about some gangsters a few blocks down.

When I tune the same freq on my bc3000 and pro-43 with rubber ducks I can only hear that one cop blacked out a few houses up. The others only four or five blocks away either don't come in at all or are static. Is this because they are on simplex? If so, does this mean simplex has a range of only a couple of blocks? Thanks for any info.

>You might have to "Play" with the resistor values, it should work..

The relay will chatter with the audio with this circuit,It needs a
capacitor between the base of the transistor and ground. The value of the
cap will determine how long the relay stays energized after the audio
stops.Also add a 1 ~ 4.7 uF coupling cap
between the 10K resistor and the audio source to block any dc.A better way
to build the circuit would be to use an op amp (using a single ended
supply) with a potentiometer to adjust the delay.This can be used to
drive the transistor.I havent figured out how to make schematics with the
PC yet, so e-mail and I can scan a drawing and send it.

Source record: 194651

Look Eric, I thought we resolved this matter three weeks ago when we agreed to stop the bickering in rec.radio.cb. But by now I have learned that every time I post in rec.radio.cb or rec.radio.scanner you will post your inane, meaningless commentary as a follow-up to any post with my screen name on it. Therefore, from now on I will just have to ignore your stupid retorts to my posts, because your ignorance apparently will not allow you to consider anyone else's point of view but your own.

I don't believe my credibility in rec.radio.scanner or rec.radio.cb is as badly damaged as yours is, Eric--far from it. How many members of rec.radio.cb or rec.radio.scanner have criticized me for not having my facts straight before I post, and how many have flamed me for my ignorance? Not more than I can count on one set of fingers, Eric. By contrast, however, your blackmail allegation several weeks ago generated over 140 posts in both rec.radio.cb and rec.radio.scanner, and nearly every one of those posts criticized you for your ignorance. While I admit that the "personal attack" on your protected characteristic (sightlessness) was not in the best of taste, I believe your constant flaming of others in rec.radio.cb and rec.radio.scanner and know-it-all attitude has a tendency to bring out the worst in people. Nevertheless, I apologize for my remark concerning your disability.

One final comment, Eric: If Frank Burns is indeed welcome on the amateur bands in Phoenix, then why is he still wasting his time trying to wind up Howard Lance Kingston, Whiskers, and other operators on 27.365 MHz LSB whenever he has an opportunity to do so? One would think that if Mr. Burns is welcomed with open arms on 2 meters and 6 meters that he wouldn't have to waste his time talking to "lowly" 11 meter operators!!

How about we just demand that they force the JBTs to OBEY the law, and do their damned homework!! Belive it or not this IS about scanners! Police officers are no better or worse than the general populace. A badge does not magicly impart noble deeds or ideals. Decent law enforcement officers will enforce the law as they see it. Employing only enough force etc as the situation requires. JBTs on the other hand LIKE it. and will kick in your door and terorize your family because THEY LIKE IT! No matter what the crime, All they require is for the powers that be to give them the where with all to GET THE JOB DONE, and damn the methods. Drugs today, guns next week, or SCANNERs next month. makes no diff. to the zealots No, these are not the rantings of a COP HATER, but a law abiding citizen who has never used his gun or his SCANNER for evil, and wants to keep them both. So when my door goes crash in the night. I hope to hell it's a Jack Booted Thug in the hallway and NOT a decent law enforcement officer who fell in with bad company, 'cause I'm gonna have to live with my actions for the rest of my life.BTW when I posted a request for freqs last week who was the first to reply? A police officer!! THEY are not all out to get US. Most are repulsed by the actions of the JBTs.They wind up being painted with the same brush by some, but not by me. Jim

4330. 930mhz frequency stuff..interesting!

I've found some interesting stuff in the 930-940 mhz area..some
businesses..America West Airlines (Cactus) does use a 935 and 936 mhz
frequency for operations.
In Los Angeles, there is a shuttle van service that uses 935.1 and 936.1

I've found MUZAK on 928.9125 and also 956.44.
can get some radio station frequencies in the 950mhz area also.

therre's some stuff around 960mhz but most of that is point to point
stuff.

anyone ever taken a scanner apart and done some repairs.
I have two AOR-1000 units.
On one of my units, I am replacing the power board...
not that difficult to do...just need to open up the unit,
remove some screws, unplug some connector plugs, and unsolder one wire.

I've fixed radios and scanners before. Sometimes, I will also make
adjustments to improve sensitivity on desired frequencies.

Boy do you have a misconception,.

400 freq's are not trunked. Who told you to write this up?

800 mghz is trunked.

You are looking for the wrong rainbow.

And Police wonder why a lot of citizens don't trust em???
Hmmm must be either naivette or plain stupidity.. Look at the force
that didn't hire intelligent officers now being sued by a high scoring
candidate. If they scored above a certain number they were "over
qualified" Yeah right... I'd want an intelligent cop cause an
unintelligent person is to easy to play mindgames with and I love
playing mindgames

Yes there are bad cops, there are also some bad laws. Why not take a bigger part in the process? You don't like the new laws coming from Washington? Why not run for an office yourself? I still beleive that the American Way still works. I think if everyone spent as much energy being involved in their Government as they do whining about it we would return to the Great Country we once were.
I'm not defending rottin Police tactics or underhanded legislation. I just feel that most cops are good. And I want to continue beleiving this.

The Hywayman

7/5 as in the US would be next month.. Got to remember these posts go
across the pond where it's DD/MM/YY!

Now for the discontinuded scanner.. Bought one a week ago.. It's the first
modern handheld scanner i've owned (old one was 6 channel crystal).. works
great for 200 bucks! Just buy NiMH batteries instead of NiCads, 1200 mH
NiMH battteries last real long, The RS 35 buck NiCad pack #23-288 only
lasts 6-7 hours on a charge.
NiMHs go 10-11 hours for 24 bucks.

It was organized, I believe, following WWII, after amateurs were
allowed to again begin communications. (Ham transmissions were
suspended on about Dec. 8, 1941, for the duration).

Bill,

Maybe you need to take a break from insuring everyone's post are accurate!

Motorola has been selling UHF (406-470) trunked radio systems for many years. The single biggest user is Uncle Sam and they have 406-420 Smartnet systems at hundreds of military and other large facilities. My MTS2000 used to work great on Kirtland Air force base's system, before reprogramming it to conventional operations.

Additionally, there are several other manufacturers that would be happy to sell you there version of UHF trunking systems, i.e. E-trunk, Smart-Trunk, etc. There are many UHF business trunked systems in operations using the above systems as well as Motorola's Smartnet system.

Give the guy a break, he, unlike you, knows what he is talking about.

Tom

On June 11, Myway asked for the 400mHz trunked frequencies for Eglin Air Force Base, Florida.
Bill Conduit wrote: "400 freq's are not trunked. Who told you to write this up? Boy, do you have a misconception. 800 mghz is trunked. You are looking for the wrong rainbow."
Well, Bill, sorry, but the rain is on your parade this time. The federal government operates many trunked radio systems in the 406 to 420mHz range. Both Motorola and Ericsson systems are in use. No, the Uniden 235XLT TrunkTracker will not track the Motorola 400mHz systems. They use a different data transfer protocol than the 800mHz public safety systems. It seems, as a general rule, that the Air Force uses the Motorola systems on their bases, and the Navy uses the Ericsson systems aboard their bigger ships, such as aircraft carriers.
The 400mHz trunked systems are also becoming more common in larger cities where they are shared by the FBI, DEA, IRS and other federal agencies.

4361. BAD NEWS For BC 235xlt owners....a problem develops with

Newsgroup: rec.radio.scanner
Date: 1997-06-12 00:00:00 UTC
From: myway@ix.netcom.com
Message-ID: <5np3a0$bri@dfw-ixnews8.ix.netcom.com>
Source record: 194685
Cross-posted to: rec.radio.scanner,alt.radio.scanner

OK....problem.

All of a sudden your scanner changes from ID Scanning
to the 800's you originally programmed in to get to
the ID's....

The scanner will not scan the ID's...it just goes
' bezerk....won't accept input to stop or to hold
or anything except to accept the order from pushing
the trunked button.

E-mailed Jeff at the Ham Station and told him of the
situation and to expect return of scanner...prior to
his reply

he e-mailed me back quickly and told me the problem
is the BNC antennae...bad pins or bad this or bad
that...sure enough, I put another BNC antennae on
and it worked. Fine. No problem.

Jeff said that there were reports of bad pins in the
center of the BNC antennae which is the source of
the problem.

So, I guess I call RS to see if they have these
antennae's to put on .....

Or i'll get a replacemnt in the mail.

Thanks Jeff for your speedy reply.

Take a look at the Trunked Radio Systems User's Page (URL below). There
is a page that deals specifically with TRSes used by the US Military.

Thanks,

Muzak is a company that provides a service. This service is the
background music you hear in many restaurants, doctor's offices,
elevators etc.

It is transmitted on the subcarrier of FM broadcast stations and
requires a special decoder to tune in.

Cheers!

I am glad you figured out this is what I was after. I
suspected that the cellular products might have this type
of battery. Now all it takes is for someone to prove it
does or doesn't. Other then that I guess the next step is
to create a hardware hack to extend the power capabilites
of the the TT. I hate cludges though since they never
look very professional when I do them. <sigh>

It is pronounced SEVEN THREE for clarity and it's much easier to understand
over the airways.
As for Morse, it still has a use as it is also easier to understand than
voice over noisy or weak tx's
I'm not a HAM but I atleast know this much.

Kindly

D.B.

I just need some more information to help solve your problem:

1. What type of antenna are you using? I assume you are probably using the rubber duckie that came with the radio?

2. What frequencies are you picking up during the day?

Have you tried running the radio in the search mode? Also, try plugging in the same freqs that you hear during the day at night.

3. Are you changing your location from day-to-night?

Why can the AR800o and other similar scanners display the
digets needed for hex on an lcd and the 235xlt can not?
Doesn't the 9000 display alpha tags also?
Abigger more legiable display on the 235xlt would have
been nice also.

In the meantime you can use Excel to generate a list of
hex codes and the decimal equivalents, print that out
and carry that with you to check a uniden decimal
talkgoup.

Only one comment, can the AOR follow Motorola Trnked Radio System communications, automatically?

Then there is no comparison. The BC235XLT is one thing only, a trunk tracking scanner. As for all other scanning things, there are dozens of better scanners, but not one that can follow trunking. For $250, that is what I bought, I use the R8500 for anything else.

No cellular, who cares.
No 1000 memories, who cares, only need 28.
When another scanner has the ability to follow trunk system(s) operations, then, let the comparisons begin, but right now there simply isn't a valid comparison out there, and, if someone actually bought a BC235 as a full featured scanner, well, next time read the literature, especially the part about trunking 800MHZ systems ONLY.

I got a question, what differance does it make. Is it easier to memorize 3000 hex codes like 1AD, 3DF, 001, 9FF etc than numbers like 4002, 240, 142. Knowing the by god Motorola hex code is only usefull if you have somehow come up with the system owners talkgroup assignments. And even then, you still have to carry a just as large cheat sheet.

Could it be that entering a numeric number on a standard numeric keypad is a lot easier than entering the letters A-F on a partial or multi-keystroke keypad. To program talkgroups into scan lists, you would need the letters A-F as well as 0-9. or at least an alpha button to change a numeric button to an alpha, which would involve another keystroke.

Joe,

Several years ago a gentleman in Canada developed a software package
that allowed users to modify Motorola radios like the GP300, Maxtracs,
etc. for additional features like more channels, out of band
programming, etc. He sold several hundred of this software. Several
months after he began advertising his software, Motorola filed lawsuit
in Canada for copyright infringement in that he supposedly had simply
used Motorola's "Lab Tool" and FTR software, changed the menus, and made
it one package for multiple radios. He lost the case.

Now comes the good part. Motorola, as part of the settlement was given
all sales records of said software, and their attorney,s sent letters to
all purchaser, stating that they were in possesion of a proprietary

product belonging to Motorola and that it was to be returned immediately to the rightful owner (Motorola) or face prosecution. And, the even better news was, you didn't get your money back.

So, if it is true, and it certainly wouldn't surprise me, and when, not if, Motorola wins it's case, you too can expect such a letter. The only good part is that with a company like Uniden, they would probably pay you back or end up going broke from bad PR.

Fortunately for someone at last weeks hamfest who bought mine from me, I don't know who he was. Darn it!

Hello All,

Today, My local Uniden dealer informed me that their distributor will send them NO MORE BC-235xlt 'TRUNKTRACKER' scanners for the indefinate time being.

I am to understand that Motorola has threatened infringement litigation towards Uniden regarding the Motorola technology that the BC-235xlt utilizes. Motorola wants a 'piece of the pie' from Uniden because it's the MOTOROLA technology that makes the TrunkTracker come alive, if you will.

So, QUESTION: Has Uniden voluntarily or legally halted the distribution of it's BC-235xlt???

Remember when you bitched at Kevin B. for selling the very first production units for 379.95??? Well, by the time this litigation comes to a conclusion, the BC-235xlt TrunkTracker may been a scanner of the past for $250-$300, or maybe HISTORY!

Remember, Motorola plays hardball and they play to WIN! (kinda sounds like a NIKE commercial, doesn't it ???)

I welcome your rebuttal's to my NEWS BREAKING POST!

Happy TrunkTracking, NOT???

After listening a little more after posting this it seems some of the cops were in someones house nearby and not in squad cars. They had to end it at 11:30 'cuz the guy had to go to bed. I don't think they were kidding either. Something about not staying up past Jay Leno on a weekday.

>Sounds like simplex alright. Did you hear a squelch tail? A dispatch
>operator? It should be obvious whether or not it's a simplex frequency.
>What was the frequency, anyhow? Repeater input/output spacings are pretty

6 months into the great lawsuit you'll be able to log onto a web site
that's not in the US and simply type in your credit card number. 2 days
later UPS will deliver it. Not a big deal.

I haven't found a good one in SJC or SCA, but if you want my advice, go up to Scanners Unlimited in Redwood City (I think, check the phone book). This is THE place to see scanners, CB's, shortware equip, antennas, etc. The prices seem ok, and the owner is reasonable. I purchased several radios over the last couple of years from them and was happy each time. I would definitly check it out.

By the way, if you find or hear of a better place in the Bay Area, let the NG know.

Keith

Hi Victor,

For people without a webpage, we offer your exact idea. A FREE
up-to-date database of frequencies supplied by hobbyists all over the
USA and Canada.

Hope this helps,

Dale

Hi there,

I believe that our website may be able to offer you what you are looking
for. We are still working on the Edmonton list, but should have it
available soon. Calgary is, however, fully functional.

You can find it at..

National Frequency Database
http://www.agt.net/public/gpnet/gpnet.htm

You may recognize the address :-)

Take care,

Dale

I once seen an article that said that all computers put out an inadvertent radio signal and that anyone could listen/or tap anothers computer and learn what was being processed. Any truth to this? Is there any special frequency or does every model of computer have its own. Will be glad to hear of any info you may have on this. Douglas

I live in Michigan and I have a technician class license. Do I need to get a permit from the "Director of State Police" to use a scanner in my car? What is the procedure to secure a permit? Does anyone have a phone number and/or an address for getting the permit? This is an excerpt from http://www.afn.org/~afn09444/scanlaws/mi_scanr.law ... but the permit issue is unclear to me...

Michigan Penal Code Section 750.508
(1) Any person who shall equip a vehicle with a radio receiving set that will receive signals sent on frequencies assigned by the Federal Communications Commission of the United States of America for police purposes, or use the same in this state unless such vehicle is used or owned by a peace officer, or a bona fide amateur radio operator holding a technician class, general, advanced, or extra class amateur license issued by the Federal Communications Commission, without first securing a permit to do so from the Director of the Department of State Police upon application as he or she may prescribe, shall be guilty of a misdemeanor, punishable by imprisonment in the county jail for not more than 1 year, or by a fine of not more than $500,00, or by both fine and imprisonment in the discretion of the court.

Any info. you can provide would be appreciated... THANKS.

If you are going to primarily use the scanner for 800 MHz trunking, get one of RS gain type portable cell phone antennas which is about 18 inches long, and has gain, as well as a tnc to bnc adapter. This works great for trunk reception...

You get a lot of radio in a small box that would normally cost much
much more! Its a great radio and very sensitive. Great for portable
use too. I use mine while camping with a laptop computer. Great fun!

4422. SUGESTION FOR POSTING TRUNK TRACKING GROUP DATA

Newsgroup: rec.radio.scanner
Date: 1997-06-13 00:00:00 UTC
From: ki4je@bellsouth.net
Message-ID: <MPG.e0af8da310f58a99896af@news.atl.bellsouth.net>
Source record: 194708
Cross-posted to: alt.radio.scanner,rec.radio.scanner

Would you like to publish your trunk tracker findings?
When you post them to USENET or mention them in one of
the mailing lists like Scan-L or Trunkcom the data may be
missed by a new user coming in after the fact. Publishing
the same data by posting it over and over again can begin
to anoy non trunk tracker owners. the folloing
observations are offered as friendly suggestions and not
as 'do it my way'.

Suggestion one

You can publish your data free on the web by using
http://www.geocities.com/
They give you up to two megs of free space and only
require that you update something at least once a month.
I lost my account since I could not remember to update
the darn thing regularly. :>(

Do you have a geocities account that is maxed out. You
might try getting a free email account at juno.com and
then using that id to establish a new geocites account.
I have not tired it but I suspect that would work. You
need a unique email account since geocities emails your
password to you.

Publishing your data.
If you have OFFICE 97 it is super simple. From Excel 97
merely save as html. A wizard helps you create a great
looking web page out of your Excel data. Remember to use
a little color in fromating the background of some of
your cells. I use light red for fire, light blue for
police etc. Format the cells before you save your data as
html.

In win 95 to see your new page from start menu drop down
to 'Documents....' and you should see the name of your
new page listed since it is one of the ten latest
documents modified. Selecting this page should instantly
display this page (or near instantly if you have a slower
PC) in your browser.

FTP that page of trunk tracking data to your free
geocites account and the whole world can read it.
Add a pointer to your data in all your posts as part of
your signature file.

Suggestion two
Arrange the data in a public directory of your harddisk and allow users to connect to you via http while you are online. This works even over a 28K dialup since relatively few will be connecting at any one instance. You have to be runnig a copy of personal web server which is free for win 95 from Microsoft. Instructions for setting it up are in the software. NT is even better for this IMHO. The advantage of this is it makes publishing and updating the data a lot easier and less time consuming.

Solving the problem of getting the IP address so a user can view your pages found on your own PC.

The IP address changes for most users every time they dial the Internet from home. This occurs when your ISP uses 'dynamic IP addressing' as most now do. A user will have to connect to you using this format.
http://207.153.1.146/default.htm
The number 207.153.1.146 is an example of a the address you would have used to connect to me via http or ftp this morning. BTW I run the free war.ftp.server when I want to allow someone to connect to myself via ftp. Check shareware.com for this FREEWARE server. Did you notice I like everything that is 'free'?

Use win95's hidden program winipcfg (run winipcfg) to see your current ip. Publish that via email, IRC chat or whatever.

Better join the free ICQ server and whenever you set it to online it automatically publishs your current IP address for other users to find and use. They can locate your IP address by clicking on your name and selecting 'info'. The IP address is displayed in the upper right hand side of the first tabbed page. This is also the area to how you can find out what the true email address is if you need to contact someone registered with ICQ via email. IMHO ICQ notes are faster then regular email for messages of 400 characters or less. See my signature for pointer to ICQ. This latter idea involves simplicty and no extra work on your part. The disavantage is not enough Internet scanner users know about ICQ and its advantages.

If you haven't tried MSIE that is another must have for easy, really easy dramatic web pages, especailly MSIE 4 which still is in pre-beta has fantasitc featues. Next month they plan to release MSIE4.2 according to email I got this week. You might want to wait for that one since this is a major download for the full ball game. (17MB!)

If you are using Netscape be warned that there is a serious security flaw in all versions from Netscape 2.0 and up including the new Communicator 4.0 that allows a devious person (wink) to browse your hard disk after you connect to a web page. More on that problem which was confirmed last night is at
http://www8.zdnet.com/pcmag/news/trends/t970612b.htm
Netscape has a major problem on their hands with this IMHO since all previous versions that Netscape considers obsolete will have to be updated. Otherwise they will have to force everyone to buy Communicator version 4 and update that one only.

If you want to try out any of these ideas or need help setting up a method of distributing your trunk tracker data via the web please contact me and as time permits I will assist you.

4425. Help!! 300MHz oscillator and mixer needed

Newsgroup: rec.radio.scanner
Date: 1997-06-13 00:00:00 UTC
From: hjerrild@post4.tele.dk
Message-ID: <5nrb9u$h3t$2@news.uni-c.dk>
Source record: 194711

Hi

I'm building my own scanner based on a UHF radio, but a lot a the interesting frequencies (e.g. Danish Police) is in the VHF band. Therefore I need this to move the VHF band up in the UHF band. I want to do that with a 300MHz oscillator and a mixer (Maybe a diode mixer) Does anybody have a good design idea for a 300MHz oscillator and mixer. A Schematic would be nice or even better a PCB drawing and schematic.

Response via e-mail very welcome.

Regards Karsten Hjerrild

John, is there any similiarity between the control channels on these
systems
and the ones normally seen in 800 mhz band? i.e. is there any hope for
trunker.exe to decode these?

If not, anyone know about them? sounds like a new spectral opening...

So if I gave you $73, you would say "seven three dollars?"
How come "seventy three dollars is bad?"

Say it any way you want. No one really gives a damn, one
way or another.

What's morse code? Is that the code they used in the 1860's
with choo-choo's?

A trademark for a particular brand of unobtrusive environmental music that is used in malls, offices, elevators, etc. It used to be broadcast using SCA signals piggybacked on local FM stations, but these days microwave and satellite links are used.

Problem in a nutshell was I paid for a 2042 and a 2042 showed up with
the insides of a 2035! so in effect I paid $310.00 for a 2035!! I have
E-mailed him several time and he will not even respond to my mail. He
has my phone number also and has not called. (his number is unlisted) He
advertised it in mint condition, but it came with the serial number and
model number removed and an antenna from like a Bearcat 890 or 9000 the
one that goes on the back of the set.

MUZAK was a scheme used by early FM Broadcasters. A subcarrier,
67 KHz as I recall, was modulated (FM) with continous music for
commercial sale to various vendors, as a 24 hour music format for
backround music. Special receivers were made available for receiving
the service.

Can't say how much it help you but the last ones we saw and the ones with
the highest s/n we had were in the 0145xx series.

There could be a large difference though in batches shipped by AOR to
European / USA distributors etc so I wouldn't like to say how accurate this
info is.

Hope its of help in your quest.

Interesting thread. Were I in your shoes, I'd pull the fuse to the scanner (assuming it were mounted in some way in your car) and remove the antenna. I would remove the batteries from a portable scanner and store them somewhere else in the trunk of the car. That and your out of state tags ought to be enough for most cops and proof of honest intentions. Of course, I'm assuming that you aren't actually trying to use a scanner in those states.

As a ham, I'd make sure I have a valid copy (preferably the original) of my license. And be sure to be as nice as possible to Officer Friendly. They don't appreciate having the law quoted to them. Tell them what they want to hear. Ask them if they'd like to inspect your radio license... If they continue, then ask for their badge number very politely, and take the whole matter to court.

I never argue with someone, especially an officer of the law, who thinks they already have all the answers. Even when you're right, they'll do anything possible to make life hard for you. If they're obnoxious or just plain wrong, take them to court and skewer them there.

After reading what most folks have posted here, I wonder what those cops would say if they saw my TS-50 (shortwave transceiver) installed in my car with my 50 MHz transverter. I don't have ham tags. Gee. I might have to try it some day...

4438. Digital Encryption for PD

Newsgroup: rec.radio.scanner
Date: 1997-06-13 00:00:00 UTC
From: Dan Rollman <kc7anq@azstarnet.com>
Message-ID: <33A12B67.168C@azstarnet.com>
Source record: 194724

The City of Tucson, Arizona PD just received their new 12ch radios with encryption capabilities. Word has it, they will begin moving the 4 main dispatch ch's (Ch1-4) to 4 new encrypted ch's (Ch7-10) in November, and by the middle of next year claim the main dispatch ch's will be entirely encrypted. They will, however, leave Ch1-6 and Ch11-12 in the clear for car to car, simple, etc.

My question is, how many other areas accross the nation have PD's that have gone encrypted on their CURRENT system (VHF or UHF) as opposed to getting a trunked system or digital TRS?

Dan

Monty,

As I wrote Bob, Quement Communications (Not Quement Electronics) on
Bascom Ave in San Jose offers a good alternative to Scanners Unlimited
in San Carlos. I find the people there to be more personable and
attentive to my needs.

jeffmulter@aol.com (JeffMulter) wrote:

>For those searching for type II system I-Ds with the Trunk Tracker, note
>that common talk groups are often spaced 32 digits apart, if going by the
>digits displayed on the Trunk Tracker.
>
First, thanks for sharing the info with us. Thought I'd add a bit
though.

Motorola Type II systems Fleet/Talk Groups are 4 Hex Digits such as
4B10
Radios are programmed for the first 3 digits such as 4B1 the fourth
digit is the type of call. Private Call, Phone interconnect, Group
call etc all have a different 4th digit. For general communications
its a "0" (zero)

Because this is hex and the next talk group would be 4B2 when you
convert it to decimal such as what the Trunk Tracker uses its 16 in
decimal. MOST but not all type II systems skip the next talk group
making it decimal 32 as you pointed out. Here in Toronto Metro
Police did something stupid and/or not following the norm. They did
not skip anything and use the next talk group. I'm sure We here in
Toronto are not alone so, It would not be a bad Idea to check every 16
decimal talk groups.

Metro Police I guess had sum dude number them from 001 to 042 Must
have known its was hex inorder to program the radios but I guess it
was too difficult to count in hex and skipped a few..
eg..

008
009
.......???
010
011

Things that make you go, hum......

I'm working on a list of the 15 types of calls for the 4th digit. I
hope to provide a list soon.

If your monitoring services such as police, note that the Dispatcher
sometimes will call just one unit this will cause the talk group to
change so if your not adding let say 11 (dec) to the talkgroup your
missing out! Generaly every 16 or 32 is where you will pick "stuff"
up.

>For instance, if you've identified a "fire ops 1" channel displaying 8624,
>it's likely that "fire ops 2" - if there is one - is at 8656.
>
So far most services I'm monitored here follow this scheme. Some
services have had channels added later and ended up very far from the
first group of channels they were assigned.

Not sure why Motorola suggests that talk groups be assigned every
other number maybe someone can shed some light on this subject.

>I presume this has something to do with the way Greg Knox wrote the code
>for Uniden, and how it converts the hex code to fit the TT display.
>
I would guess they did not want to confuse others with Hex and or the
display would have to be redesigned to display text.....too bad.

>In the near future, I hope to have the time post the I-Ds for the

4442. Great Antenna Suggestion

Newsgroup: rec.radio.scanner
Date: 1997-06-13 00:00:00 UTC
From: Karl Wolf <kwolf@cen.com>
Message-ID: <x1hgf2a5tp.fsf@dog.i-did-not-set--mail-host-address--so-shoot-me>
Source record: 194728

I saw this antenna suggested on the AR8000 mail list, so I decided to give it a try. It's from Radio Shack (let's don't get into that) and its called "Amplified VHF/UHF/FM Portable Antenna". As you can tell by the name, its intended for TVs and radios. When I mentioned to the sales droid that I was going to hook it up to a scanner, he gave me "one of those looks".

Description:

About 1/2 inch thick by 3.5" wide by 5" tall.

It runs on either 2 AA batteries or AC adaptor (supplied)

Two telescoping 9 section whips. (Fold nicely down the side when not in use)

A builtin three position stand, again nicely integrated with the case.

Connecting cable ending in a 1/8" (3.5mm) plug. (Needs adaptors, see below)

Boost/Normal switch with Boost active LED.

Specs:

Range: 50-900 Mhz
Gain: 10db Min for 50-470 Mhz
8db Min for 470-900 Mhz

Noise: 10db max.
Impedance: 75 Ohm

Results:

I bought it yesterday, so I haven't had much time to test it. However, my initial impression is, the Boost setting dramatically improves the the signal. On freqs. where my RS whip or Diamond antenna read about 1 or 2 on the S meter, this antenna (Boost on) reads 6 or 7. Some freqs that were noisy previously, come in strongly with far less noise.

What to buy:

Amplified VHF/UHF/FM Portable Antenna (RS# 15-1607) $24.99

RCA to BNC Adaptor (RS# 278-254) $2.99 (gold version $3.99)

Phono Plug adaptor (RS# 274-326) $1.89

I'd be interested in other folks experiences with this antenna.

You need a lot more help than that. By system do you mean a 5ch or 20
channel trunked system or a single radio to work on the system. Trunked
Programming software is available (legally) only to the trunked system
owners and is called a system key and operates in conjunction with
normal programming software. It is also, SYSTEM EXCLUSIVE! It will only
work with the one system ID used by the system owner and IT DOES NOT
work on any other trunked systems.

Yup, simplex direct, car to car or handheld to handheld. Cool. The height of your antenna is a huge factor in determining how far away one can hear weak signals. Your 2006 with outisde antenna left the handhelds and their rubber ducks in the dust. Using a Diamond V2000a at about 45 feet / RG-8 I am hearing 50-100watt mobiles quite well almost 10 miles away in a heavy urban area (Chicago N Suburbs) and handhelds 3-4 miles.

I had a friend who a 760xlt (similar radio) in his auto, which had electrical problems, short circuits, blown fuses, too many radios installed over the years... He sometimes lost his programming when one of the fuses would go out, some sort of surge. I would suggest leaving radios turned off when you turn on / turn off the ignition keyswitch. Some cars generate spikes in their elctrical systems when turned off and on. Try resetting your 2026 and see if the cpu resets. Re-program a few channels, test the service searches, weather, etc. Good luck

Source record: 194441

Another newcomer to the hobby warmly greeted and assisted by our local experts. Seriously, I find multiple radios come in the handy-est during major events (disasters, parades, airshows, Bulls victories, etc). I use one radio for each type of service / branch of service / location that I'm interested in. Last night I had one on Chgo PD Citywides and Northside Zones, another on local suburban stuff, another on CPD's trunked system and other lesser used stuff, and another radio on the VFR aero freqs for all the copters that were flying. Sometimes you may find you are hearing more by having each radio sitting on one busy, local freq, as opposed to having them all scanning. Listening to more than one radio at a time is an aquired skill. It helps to use external speakers spaced some distance apart. Other hobbysists swear by those "pilot light mods", where a little LED lights up when a radio's squelch opens, so you know which one the signal is coming in on at a glance.

Happy Scanning and welcome to the hobby. Where are you at and what type of services do you enjoy monitoring? Favorite local Freqs???

From: tandkmoran@aol.com
Message-ID: <19970614181400.OAA27598@ladder02.news.aol.com>
Source record: 194442

Minimum feature for the aero buff: 118.000 -to- 136.000 Freq Coverage, AM Mode

Other useful features:
136.000 - 136.975 (AM Mode) Aero Band Expansion
138.000 - 150.000 (AM Mode) USAF Air to Air Tac Channels
225.000 - 400.000 (AM Mode) USAF / UHF ATC Operations

Note that many radios cover the first two ranges, but in a "default mode" (FMN), which cannot be changed manually by the user.

Other things to look for:
-Selectable or Programmable step sizes in search mode, 25 Khz being use ful for VHF Freqs, 25 / 50 / 100 Khz being useful for 225-400 Band.
-Lockout from search
-Search and Store, for finding new freqs unattended
-An S-Meter (signal strength meter) for guessing at system coverage / aircraft distance
-An attenuator, for reducing interference, especially good at urban area airshows
-108.000 - 118.000 Freq coverage for checking on VOR's, AWOS outlets & Nav systems
-000.200 - .000.560 Low band coverage for checking out NDB's, normally found only on very high end scanners or shortwave / communications receivers, of somewhat limited interest
001.700 - 030.000 Single Sideband Shortwave utility coverage for overseas Aero stuff.
-an earphone jack
-ability to use disposable batteries
-freedom from images, fire / business band / pagers tend to get picked up on VHF aero, this means a triple conversion receiver, probably, though some of the newer triple coverage radios get interference in the VHF aero band from cell phones.

My favorite airshow radio (still!) the AR-1000, good intermod resistance, programmable step size, slectable modes, lockout from search, disposable batteries, attenuator.

Start with http://www.airnav.com/airports/ for freq info. Clear skies and Happy Scanning!

Just a note for all you care. The Klintons are going to attempt to pass more anti-gun, anti-Second Amendment legislation in the near future. We must oppose those who will remove our freedoms. Make certain that your voice is heard on this issue with your two Senators and one House member in Congress. Dont bother writing Klinton, he does not care what you or I think. He has an agenda. Socialism with no guns is his goal for the USA.

Secretly taped phone conversation here in Dallas just recently cost a School board member his postion and the legal ramifications are not yet over.

He was talking with a friend and make comments regarded as racial slurs.

They were admitted into court and there was no wiretap warrant.

4464. ********WHY MOD SCANNERS FOR CELL?**********

Newsgroup: rec.radio.scanner
Date: 1997-06-14 00:00:00 UTC
From: eugened@aol.com
Message-ID: <19970614204500.QAA10605@ladder02.news.aol.com>
Source record: 194450

I have seen endless postings of people asking and giving mods for scanners to allow cellular telephone recepeption. But did you ever stop to think how much easier it would be to mod a cell phone into a cellular scanner??? Before you start laughing at me, think about this: Cellular phones are specially made to be used on cell freqs, but scanners are specially made NOT to be used on cell freqs. Instead of wasting time, money and possibly taking the risk of messing up you scanner you could do a very simple mod to a cell phone. Want an example? On the 94' Motorola (R) flip phones there are three power pins on the side of the phone. The two outside ones are used to give the phone power, but the inside pin is lowered so it JUST doesn't touch the battery. Now the mod is: put a piece of tin foil in the center pin, and close up the phone. It's that simple! Then you just press #, #08, #11xxxx, xxxx can be replaced with any number between 1 and 1000 to set it to the proper cell channel. Now, compare this to the often fatal mods that can be done to scanners. Cell phones can be bought for as cheap as $15 at flea markets (that's how I got mine.) If you want some more info on this you may email me.

Bye, 73's,

A good scanner for you would be the Radio Shack PRO-41. It has 10 channels and a priority channel. There is also a mod to extend in into the air band.

How's about a little honest experience here? Here's a taste of mine.

A few years ago, I was living in Marietta, GA. My apt. gets robbed. The cops take a day and a half to respond, and when they do, they take a statement, after which telling me that NOTHING is going to happen, other than a clerk checking serial numbers of electronic shit against things listed in local pawn shops.

He was cool, friendly, and he did appologize that nothing could be done, but I still couldn't figure for the life of me why I bothered to call the cops.

The number of times I have had to deal with situations like this one, it always turned out the same. "I'm sorry, but there's nothing we can do. Better luck next time."

4467. NJ State PD Trunking Question

I'm currently using the following user-definable fleet map for the NJ State 800 system on my trunk tracker:

b0= s13
b4= s12
b6= s0
b7= s0

I'm getting good results but was wondering if this is the correct configuration. Is anyone else using something different? Thanks in advance for any suggestions, comments.

Dave

Their is some thing call statistic. Police officers do not like to file reports. Department now are hiring police assistance to do 95% of the paper work. What is left for the cops, That should not be hard to figure that out.

Mike <shaggy@uia.net> asked:
> Can someone please repost the cell phone frequencies.

From the FAF - Frequently Asked Frequencies
on ftp://oak.oakland.edu
as /pub/hamradio/docs/misc/scanner.faf

Cellular Telephone [22.902]

Chs Freqs (base) System Use

991-1023 869.040 - 870.000 A - RCC voice
1-312 870.030 - 879.360 A - RCC voice
313-333 879.390 - 879.990 A - RCC data
334-354 880.020 - 880.620 B - Telco data
355-666 880.650 - 889.980 B - Telco voice
667-716 890.010 - 891.480 A - RCC voice
717-799 891.510 - 893.970 B - Telco voice

Transmissions are FM (some systems are adding digital).
Channels are 30 kHz apart. Mobiles transmit 45 MHz below the
base (824.040-848.970) and are usually repeated by the base.
Channels 991-1023 are also identified as Chs 800-832.

!!!!!!!!!!!!!! L O O K H E R E !!!!!!!!!!!!!!!!

$$$ Mailbox Cash $$$

A little while back, I was browsing these newsgroups, just like you are now, and came across an article similar to this that said you could make thousands of dollars within weeks with only an initial investment of $5.00! So I thought, "Yeah, right, this must be a scam," but like most of us, but I was curious, so I kept reading. Anyway, it said that you send $1.00 to each of the 5 names and address stated in the article. You then place your own name and address in the bottom of the list at #5, and post the article in at least 200 newsgroups. (There are thousands.) No catch, that was it.

You can make up to or over $50,000.00 in 4-6 weeks, maybe sooner! I SWEAR, I'M NOT LYING TO YOU, AND THIS IS NOT A SCAM! If you're interested in making some big bucks, keep reading; if you're not, I apologize for wasting your time.

So after thinking it over, talking to a few people first, I figured what have I got to lose except for 5 stamps and $5, right? One person who very recently had tried it said it worked like a charm. He started getting money in the mail! He was shocked! He figured it would end soon, and didn't give it another thought. But then the money kept coming IN - tripling in size and multiplying by 10 - 20 times the amount that he got the first week! In his first week he had made a total of over $1,000!!! In the third week he had over $10,000 dollars, and it's still growing! This is his fourth week and he's made about $42,000 Total, and believe it or not the money is still coming in...

I know this has been checked out several times with the legal community

and is deemed perfectly Legal, but being a very cautious person, I also wanted to check it out with the US Post Office. I called them (1-800-725-2161) and explained this process and asked if there were any regulations that would be violated by doing this. Without hesitation, the postal official also said it is legal. At that point, I felt comfortable going ahead and joining the process.

Let me tell you how this works and most importantly, WHY IT WORKS!...Also, make sure you print a copy of this article NOW, so you get the information from it, and begin making money. The process is very simple, and it consists of 3 ease steps:

STEP 1: Get 5 separate pieces of paper and write the following on each sheet of paper: "PLEASE PUT ME ON YOUR MAILING LIST. YOU ARE NUMBER #." Get five $1 bills, and place ONE inside each piece of paper that you have just written on, and fold each piece of paper so the bill will not be seen in the envelope (otherwise, nosy people who like to steal envelopes with money in it will not get yours). Put one paper inside the envelope and seal it. Do the same for all 5. You should now have 5 envelopes sealed, each having a piece of paper AND the $1 bill inside.

NOTE: Make sure those words that were stated above are written on each piece of paper. What you are doing is creating a service by this. This is PERFECTLY LEGAL. Now, mail the 5 envelopes with the paper and $1 in each to the following 5 addresses:

#1 G. Cisnero

VLN 1151

Unit C-105

1601 N.W. 97th Av.

Miami, FL 33172

#2 S.A.

P.O. Box 758

Grover Beach Ca 93483

#3 C. Smith

240 Sunnyridge ave #112

Fairfield, CT 06430

#4 M.Boles

1159 Harrison Pike

Apt. # 2303

Cleveland, TN 37311

#5 Tom Boruta

8529 Corsica

Jenison, MI 49428

STEP 2: Now take the #1 name off the list that you see above, move the other names up (5 becomes 4, 4 becomes 3, etc...) and add YOUR Name as number 5 on the list.

STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post your amended article to at least 200 newsgroups. (I think there is close to 18,000 groups) All you need is 200, but remember, the more you post, the more money you make!

Don't know HOW to post in the newsgroups? Well, do exactly the following:

FOR NETSCAPE USERS,

1) Click on any newsgroup, like normal. Then click on "To News, which is in the top left corner of the newsgroup page. This will bring up a message box.

2) Fill in the SUBJECT with a flashy title, like the one I used, something to catch the eye!!!

3) Now go to the message part of the box and retype this letter exactly as it is here, with exception of your few changes. (Remember to add your name to number 5 and move the rest up)

4) When you're done typing in the WHOLE letter, click on FILE above

the

send button. Then, SAVE AS.. DO NOT SEND YOUR ARTICLE UNTIL YOU SAVE

IT. (So you don't have to type this 200 times :-)

5) Now that you have saved the letter, go ahead and send your

first

copy! (Click the SEND button in the top left corner)

6) This is where you post all 200! OK, go to ANY newsgroup

article

and

click the TO NEWS button again. Type in your flashy subject in the

SUBJECT BOX, then go to the message and place your cursor here. Now

click on ATTACHMENT which is right below the SUBJECT BOX. Click on

attach file then find your letter wherever you saved it. Click once on

your file then click OPEN then click OK. If you did this right, you

should see your filename in the ATTACHMENT BOX and it will be

shaded.

NOW POST AWAY!!

IF YOU ARE USING INTERNET EXPLORER:

It's just as easy, holding down the left mouse button,

highlight this entire article, then press the CTRL key and C key at the

same time to copy this article. Then print the article for your records

to have the names of those you will be sending $1.00 to.

NEXT, Go to the newsgroups and press POST AN ARTICLE type in your

flashy subject and click the large window below. Press CTRL and V and

the article will appear in the message window. ** BE SURE TO MAKE YOUR

ADDRESS CHANGES TO THE 5 NAMES. ** Now re-highlight the article and

re-copy it re-copy it so you have the changes.... Then all you have to

do for each newsgroup is CTRL and V and press POST. It's that easy!!

THAT'S IT! All you have to do is jump to different newsgroupes and

post away, after you get the hang of it, it will take about 30 seconds

for each newsgroup!

** REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE
MONEY YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF
200 **

This is WHY this works!

Out of 200 postings, say I receive only 5 replies (a very low example). So then I made $5.00 with my name at #5 on the letter. Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my name at #4 and only 5 persons respond to each of the original 5, that is another $25.00 for me, now those 25 each make 200 MINIMUM posts with my name at #3 and only 5 replies each, I will bring in an additional $125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #2 and only receive 5 replies each, I will make an additional $626.00! OK, now here is the fun part, each of those 625 persons post a MINIMUM 200 letters with my name at #1 and they each only receive 5 replies, that just made me $3,125.00!!! With an original investment of only $5.00!

AMAZING! And, as I said 5 responses is actually VERY LOW! Average is probable 20 to 30! So lets put those figures at just 15 responses per person. Here is what you will make:

at #5 $15.00

at #4 $225.00

at #3 $3,375.00

at #2 $50,625.00

at #1 $759,375.00

When your name is no longer on the list, you just take the latest posting in the newsgroups, and send out another $5.00 to names on the list, putting your name at number 5 again. Then start posting again. The thing to remember is, do you realize that thousands of people all over the world are joining the Internet and reading these articles every day, JUST LIKE YOU are now!! So can you afford $5.00 and see if it really works?? I think so - People have said, "what if the plan is

played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new honest people who are joining the Internet and newsgroups everyday and are willing to give it a try? Estimates are at 20,000 to 50,000 new users, every day, with thousands of those joining the actual Internet. Remember, play FAIRLY and HONESTLY and this will work. You just have to be honest. Make sure you print this article out RIGHT NOW, also. Try to keep a list of everyone that sends you money and always keep an eye on the newsgroups to make sure everyone is playing fairly. Remember, HONESTY IS THE BEST POLICY. You don't need to cheat the basic idea to make the money!! Also remember that if nobody sends money then nobody benefits. I'm sure you would want the people after you to send in their money.

So think of it this way, you are giving them a gift in return for introducing

this wonderful money making method to you. If everybody pays, everybody gains.

GOOD LUCK to all and please play fairly and reap the huge rewards from this, which is tons of extra CASH. ** By the way, if you try to deceive people by posting the messages with your name in the list and not sending the money to the rest of the people already on the list, you will NOT get as much. Someone I talked to knew someone who did that and he only made about $150.00, and that's after seven or eight weeks! Then he sent the 5 $1.00 bills, people added him to their lists, and in 4-5 weeks he had over $10k. This is the fairest and most honest way I have ever seen to share the wealth of the world without costing anything but our time!!! You also may want to buy mailing and e-mail lists for future dollars.

Please remember to declare your extra income. Thanks once again

:)

I'm currently searching for a first time scanner, and there are a few questions of mine that have been unanswered. I hope that someone can provide me answeres to my questions. You'll have to forgive my ignorance, as I've only been reading this particular newsgroup for about a week.

1) I've heard a lot of talk about the 800 Mhz band. Should I look for a scanner capable of recieving this band?

2) Would a scanner with 100 cnannels be sufficent?

and

3) Should I consider buying an antenna even though this will be my first scanner?

If they follow the same plan as the FDNY you can find the maps in the Scanner Master book for the NYC metro area. I have the 1988 edition that uses maps from 1979, so I couldn't tell how accurate they are these days.

Has Suffolk County gone to their 800 MHz trunked system yet?

Sufficient signal strength will make its way into any radio -
particularly UHF... and the 8 ft of coax will act as an antenna since it
is not 100% shielded.

A little while back, I was browsing these newsgroups, just like you are now, and came across an article similar to this that said you could make thousands of dollars within weeks with only an initial investment of $5.00! So I thought, "Yeah, right, this must be a scam," but like most of us, but I was curious, so I kept reading. Anyway, it said that you send $1.00 to each of the 5 names and address stated in the article. You then place your own name and address in the bottom of the list at #5, and post the article in at least 200 newsgroups. (There are thousands.) No catch, that was it.

You can make up to or over $50,000.00 in 4-6 weeks, maybe sooner! I SWEAR, I'M NOT LYING TO YOU, AND THIS IS NOT A SCAM! If you're interested in making some big bucks, keep reading; if you're not, I apologize for wasting your time.

So after thinking it over, talking to a few people first, I figured what have I got to lose except for 5 stamps and $5, right? One person who very recently had tried it said it worked like a charm. He started getting money in the mail! He was shocked! He figured it would end soon, and didn't give it another thought. But then the money kept coming IN - tripling in size and multiplying by 10 - 20 times the amount that he got the first week! In his first week he had made a total of over $1,000!!! In the third week he had over $10,000 dollars, and it's still growing! This is his fourth week and he's made about $42,000 Total, and believe it or not the money is still coming in...

I know this has been checked out several times with the legal community and is deemed perfectly Legal, but being a very cautious person, I also wanted to check it out with the US Post Office. I called them

(1-800-725-2161) and explained this process and asked if there were any regulations that would be violated by doing this. Without hesitation, the postal official also said it is legal. At that point, I felt comfortable going ahead and joining the process.

Let me tell you how this works and most importantly, WHY IT WORKS!...Also, make sure you print a copy of this article NOW, so you get the information from it, and begin making money. The process is very simple, and it consists of 3 ease steps:

STEP 1: Get 5 separate pieces of paper and write the following on each sheet of paper: "PLEASE PUT ME ON YOUR MAILING LIST. YOU ARE NUMBER #." Get five $1 bills, and place ONE inside each piece of paper that you have just written on, and fold each piece of paper so the bill will not be seen in the envelope (otherwise, nosy people who like to steal envelopes with money in it will not get yours). Put one paper inside the envelope and seal it. Do the same for all 5. You should now have 5 envelopes sealed, each having a piece of paper AND the $1 bill inside.

NOTE: Make sure those words that were stated above are written on each piece of paper. What you are doing is creating a service by this. This is PERFECTLY LEGAL. Now, mail the 5 envelopes with the paper and $1 in each to the following 5 addresses:

#1 G. Cisnero

VLN 1151

Unit C-105

1601 N.W. 97th Av.

Miami, FL 33172

#2 S.A.

P.O. Box 758

Grover Beach Ca 93483

#3 C. Smith

240 Sunnyridge ave #112

Fairfield, CT 06430

#4 M.Boles

1159 Harrison Pike

Apt. # 2303

Cleveland, TN 37311

#5 Ladd Straat

200 Jefferson Dr.

Houma, LA 70360

STEP 2: Now take the #1 name off the list that you see above, move the other names up (5 becomes 4, 4 becomes 3, etc...) and add YOUR Name as number 5 on the list.

STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post your amended article to at least 200 newsgroups. (I think there is close to 18,000 groups) All you need is 200, but remember, the more you post, the more money you make!

Don't know HOW to post in the newsgroups? Well, do exactly the following:

FOR NETSCAPE USERS,

1) Click on any newsgroup, like normal. Then click on "To News, which is in the top left corner of the newsgroup page. This will bring up a message box.

2) Fill in the SUBJECT with a flashy title, like the one I used, something to catch the eye!!!

3) Now go to the message part of the box and retype this letter exactly as it is here, with exception of your few changes. (Remember to add your name to number 5 and move the rest up)

4) When you're done typing in the WHOLE letter, click on FILE above the send button. Then, SAVE AS.. DO NOT SEND YOUR ARTICLE UNTIL YOU SAVE

IT. (So you don't have to type this 200 times :-)

5) Now that you have saved the letter, go ahead and send your

first

copy! (Click the SEND button in the top left corner)

6) This is where you post all 200! OK, go to ANY newsgroup

article

and

click the TO NEWS button again. Type in your flashy subject in the

SUBJECT BOX, then go to the message and place your cursor here. Now

click on ATTACHMENT which is right below the SUBJECT BOX. Click on

attach file then find your letter wherever you saved it. Click once on

your file then click OPEN then click OK. If you did this right, you

should see your filename in the ATTACHMENT BOX and it will be

shaded.

NOW POST AWAY!!

IF YOU ARE USING INTERNET EXPLORER:

It's just as easy, holding down the left mouse button,

highlight this entire article, then press the CTRL key and C key at the

same time to copy this article. Then print the article for your records

to have the names of those you will be sending $1.00 to.

NEXT, Go to the newsgroups and press POST AN ARTICLE type in your

flashy subject and click the large window below. Press CTRL and V and

the article will appear in the message window. ** BE SURE TO MAKE YOUR

ADDRESS CHANGES TO THE 5 NAMES. ** Now re-highlight the article and

re-copy it re-copy it so you have the changes.... Then all you have to

do for each newsgroup is CTRL and V and press POST. It's that easy!!

THAT'S IT! All you have to do is jump to different newsgroupes and

post away, after you get the hang of it, it will take about 30 seconds

for each newsgroup!

** REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE

MONEY YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF

200 **

This is WHY this works!

Out of 200 postings, say I receive only 5 replies (a very low example). So then I made $5.00 with my name at #5 on the letter. Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my name at #4 and only 5 persons respond to each of the original 5, that is another $25.00 for me, now those 25 each make 200 MINIMUM posts with my name at #3 and only 5 replies each, I will bring in an additional $125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #2 and only receive 5 replies each, I will make an additional $626.00! OK, now here is the fun part, each of those 625 persons post a MINIMUM 200 letters with my name at #1 and they each only receive 5 replies, that just made me $3,125.00!!! With an original investment of only $5.00!

AMAZING! And, as I said 5 responses is actually VERY LOW! Average is probable 20 to 30! So lets put those figures at just 15 responses per person. Here is what you will make:

at #5 $15.00

at #4 $225.00

at #3 $3,375.00

at #2 $50,625.00

at #1 $759,375.00

When your name is no longer on the list, you just take the latest posting in the newsgroups, and send out another $5.00 to names on the list, putting your name at number 5 again. Then start posting again. The thing to remember is, do you realize that thousands of people all over the world are joining the Internet and reading these articles every day, JUST LIKE YOU are now!! So can you afford $5.00 and see if it really works?? I think so - People have said, "what if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new

honest people who are joining the Internet and newsgroups everyday and are willing to give it a try? Estimates are at 20,000 to 50,000 new users, every day, with thousands of those joining the actual Internet. Remember, play FAIRLY and HONESTLY and this will work. You just have to be honest. Make sure you print this article out RIGHT NOW, also. Try to keep a list of everyone that sends you money and always keep an eye on the newsgroups to make sure everyone is playing fairly. Remember, HONESTY IS THE BEST POLICY. You don't need to cheat the basic idea to make the money!! Also remember that if nobody sends money then nobody benefits. I'm sure you would want the people after you to send in their money.

So think of it this way, you are giving them a gift in return for introducing

this wonderful money making method to you. If everybody pays, everybody gains.

GOOD LUCK to all and please play fairly and reap the huge rewards from this, which is tons of extra CASH. ** By the way, if you try to deceive people by posting the messages with your name in the list and not sending the money to the rest of the people already on the list, you will NOT get as much. Someone I talked to knew someone who did that and he only made about $150.00, and that's after seven or eight weeks! Then he sent the 5 $1.00 bills, people added him to their lists, and in 4-5 weeks he had over $10k. Source record: 194469

There are a few simple things I can think of to do.
First, if you want sensitivity just within your workshop area,
try connecting a 30 or 40 dB attenuator between antenna and
scout (I think it's a BNC connector, then something like a
mini-circuits CAT-30 would do).

Second, try a trap filter for the band you don't want.
I would try a coaxial stub in your case. Connect a coaxial "T"
between antenna and scout. Attach an open-ended 30 cm length of
coax to the "T", tune in to a mid-band (837 MHz) interference
source, cut down about 1/2 cm of the coax at a time until the
interference is gone. (should happen around 23 cm somewhere)
If you want the coax coiled, do so before tuning it.
Make sure there are no wire strands to short out the cable end
after each cut. This trap may not cover the entire band you mention,
but it's worth a try.

There are more elegant and expensive solutions too, but these
have worked for me. For further reference, consult some amateur
radio book on VHF /UHF. The ARRL Radio Amateur's Handbook is
always a good source of information.

Hmmmm.

My TT setup:

BC235 269
Cable to go from TT to car radio/cd player input instead of speaker 5
Don't need a speaker at desk, loud enough 0
New antenna (found at ham fest) 1
Car holder (Piece of velcro on TT, sticks to seat cover) 1

Total 276 dollars, less tax.

Andy

(snip)

You can't "rob" an apartment. Robbery is a crime against persons. Your apartment was "burglarized"...YOU can be robbed if the bad guy takes something from you in person.

So here we have someone that doesn't even know the difference between robbery and burglary trying to sound like an expert on law enforcement. Your credibility directly corresponds with your accuracy.

There is a difference. Software is licensed to the user. The user does
not own the software. Someone who does not own the software cannot
license someone else to use it. A scanner is a piece of physical
property. You buy and own all of the hardware and firmware sold to you.
What patent infringement case in the United States, excluding software,
has ever resulted in a third party being forced to turn over property to
another party without compensation?

>Jeanette

Jeanette-
You have posted this to the correct newsgroup. Unfortunately the 10-codes vary widely from area to area. Hopefully someone from Indianapolis will be able to get you a pretty good listing of your local 10-codes. Some areas have adopted basic 10-codes and have adjusted them to fit their needs. That is what my local agencies have done. If you want to see how closely my are 10-codes are to your area, you can go to http://www.tfsksu.net/~wiggie/KS_freqs.html . Pay attention when they are going over the driver's license info and the vehicle registration. The area dispatchers will say, "your 27 returns to Joe Smith of Kansas City, valid class C, no restrictions and 3 priors...your 28 returns on a 1995 Nissan Maxima to Joe Smith". These correspond the the 10-27 and 10-28 respectively. Hopefully though that some Indiana scannists can get you a complete listing for your area.

I doubt it. If someone wants something and is willing to pay for it,
someone will produce it and sell it to him. Apparently the 'secret' to
making trunk tracking scanners is 'out'. I got faith in the almighty
buck. just look at drugs for example. If you go the money, you can have
the drug.

-> WRONG! Motorola is an international company. If they win, they will
-> no longer be produced, period. If there is a lawsuit.

Uniden is ALSO an international company, and they sure wouldn't have had their attorneys sitting on their hands during this. It's unlikely that they'd have started producing the radio without knowing that they were clear on the legal froont. Of course, that wouldn't stop Motorola from TRYING to stop production, but a suit in the U.S> wouldn't necessarily have effect everywhere Uniden has a presence.

But in ANY case, no one else has heard anything about any suit by Motorola, OR about a production stoppage by Uniden.

> 1) I've heard a lot of talk about the 800 Mhz band. Should I look for a
> scanner capable of recieving this band?

Depends on the services in your area. You are usually well
covered to get one with 800MHz though.

> 2) Would a scanner with 100 cnannels be sufficent?

Not unless you live in the middle of nowhere. 100 is becoming
more and more outdated. Try to get at least 200 if not more.

> 3) Should I consider buying an antenna even though this will be my
> first scanner?

What kind of antenna? An external antenna? Or perhaps a better
whip antenna for better pick-up inside? If you are new, there
is not reason to run out and buy one just yet. Get up to
speed on what you can and can't hear, how the radio works,
how to set-up a good monitoring regimen and develop a log
of active freqs in your area. Then look into extending your
range by getting a better antenna.

You'll also have to answer other questions, like how much are
you willing to spend? Do you want base, handheld or mobile?
What features? What frequency coverage?

Have a look at the web page below and my New User FAQ. Any
questions, feel free to e-mail me. Good luck!

Here in Toronto we have a bird problem. They seem to be
leaving gifts for us on our cars, homes, grass, you name it. The
Ministry of the Environment has hidden little transmitters in bait
food that the birds eat and as the birds fly overhead passing wind or
simply losing control of their bowels it signals this small
transmitter which we can hear on our scanners. This gives us warning
so that we can take evasive action.

Phase II of the project is to map the signals and show a daily
report of areas to avoid. Only major problem with this whole setup
is that every once in a while the birds have to be caught and the
batteries have to be recharged. I won't get into how its done, I'm
sure your can figure it out.

As I understand and read the law (and the way it's been explained to
me) any person except a police officer *OR* a licensed amateur radio
operator (technician class or higher) must secure the permit to
legally operate the scanner in a vehicle. In other words it's *legal*
for police officers *AND* tech class and higher class amateur radio
operators. If you plan to use a scanner in your car I would *strongly*
suggest you carry a copy of this law 750.508 with you *and* your
amateur radio license.

Interesting contrast.... on the one hand, you guys in this group seem
to be going out of your way to put down the ones who speak out against

the 'Jack Booted Thugs'. Yet here we have a thread describing dickhead
cops who hassle people over something as insignificant as a scanner.
Now would you have us believe the same cops couldn't be JBT's ?
Especially after swearing out a false or misleading warrant to a judge ?

>reply by emailing me)

It is copyright-fee free music sold by the Muzak Corporation.

Any other type of music requires copyright and performer's fees to be
paid everytime the piece of music is played.

The reason "Muzak" sounds "strange" is that it is not performed by the
"original" artists; the performers are normally session musicians who
give up their rights to performance fees and are just paid once.

Your're getting what is commonly called an intermod. Transmitters
that are too close to your receiver, are overloading the front end.

In the 168 to 174 MHz range, some channels have been assigned for
Telemetry use...instrumentation, generally for governmental/public
utility use. In our area, some of these channels are used for packet
(data burst) use, for reporting water preasure/water tank levels for
the public water supply information back to a central monitoring point.

Hi David, I think you are close but a little off as to MUZAK.. MUZAK
is a commercial background music service. ASCAP BMI SESAC etc
copyright fees ARE paid by MUZAK for each of their subscription
customers. Customers pay a monthly fee to have MUZAK played in their
store or office. MUZAK pays copyright fees of several dollars per
month, per customer, and even more for larger stores or malls. You
are correct, most of the music is re-played in a studio or at least
re-mixed to become MUZAK. The whole concept is one of engineered
music. Music that you hear and it makes you feel good and ready to
spend money in the store, but NOT music that you LISTEN to. If you
listen to the MUZAK then you are not buying from the store. Thats why
most is re-performed to make it music that you will hear but not
attention getting etc.

As to listening to MUZAK on a scanner etc. NOT in a commercial
location. I have never heard of anyone trying to bust someone for
listening to MUZAK in their home.. BTW in the 950mhz area MUZAK
and others have links that may also have more contempory music for
customers who want that type of programming.. Hope this helps

Ridgecrest California PD has been DES capable for many years now.

They have used the same VHF freqs for many more years, with no changes when they went DES. However, they only use the DES for some transmissions, not all. Also it seems that when DES is used they are not going through the repeater but instead transmitting directly on the repeater output freq.

Later,

4540. Distributors Wanted NOW!!

Newsgroup: rec.radio.scanner
Date: 1997-06-14 00:00:00 UTC
From: Tony Scott <summer@laoffices.com>
Message-ID: <5nue6b$84p$9414@cadmium.aware.nl>
Source record: 194529

Hi,

This is a Solicitation Email, we are looking for new TUFF'97 DISTRIBUTORS.
TUFF'97 is a promotional concept for a prospect follow-up system called
"Simple Track". Software designed for Windows 95, 3.11 and NT
machines. (Macintosh users read the NOTE below(*))

Concept:

The TUFF'97 software includes a copy of Simple Track, so you can use this
for your own personal administration (free). However, the TUFF'97 software
is designed to give you BIG TIME credits for just taking the efforts to
PROMOTE it.

How do I get those credits?. Easy, just distribute/promote it. How?
(Give away the software for free, put it on your website/homepage
and let everyone download it. Give it to your friends, attach it by
email etc). With a one time $40.00 (USD) validation code purchase,
YOUR name becomes part of all sofware you sent out to your customers.
When your TUFF'97 software gets validated, all your personal information is
automatically integrated in the software, so everyone knows how to reach
you by phone/fax or email and where to sent the check/money or cash orders.

Basically this is the concept. Offcourse you need the software to grasp
the whole thing. Believe it, there is absolutely no marketing knowledge
required, just ask for the software package, join and start promoting your
own TUFF'97 line. The only thing you DO need is a PC or Mac(*) and Internet.

(*) TUFF'97 is only available for MacOS users running Connectix VirtualPC
or Insignia's Sofwindows 95/3.11. A true MacOS version is not available.

When you're interested in becoming a TUFF'97 distributor and create your own
distribution line, sent a mailto:FiReStArTeR@frodo.com and ask for your
copy of the TUFF software (We'll sent you a download location and install
instructions). This is a serious opportunity, so only serious responses
are processed. If you're not interested, have a nice day.
Best Regards,
Tony Scott

OK, now that the fact Eglin AFB uses a trunked
radio network has been established. Did anyone
come back with some frequencies?

Here's my list from monitoring the system with a
spectrum analyzer for a few days. I monitored
everything here, I just haven't had the time to
sit down and get serious with verifying them yet.
Duke and Hurlburt use a different range, I think
410-413 or so, but I haven't had much time for any
scanner stuff lately, maybe someone else can help
with those. I think there's a reference to Eglin
trunked system in the Police Call too, although
I'm not certain of that either.

Message-ID: <19970614181400.OAA27545@ladder02.news.aol.com>
Source record: 194537

Our members have reported variable results with the unit. For scanners with fairly poor sensitivity and fairly strong front ends they have worked well. Others get overloaded. I suspect the quality control on these sorts of products varies, and the specs may not be the same for each individual unit. Yes, they will boost signals that are already being received. But in terms of hearing weaker signals than you could hear before note that the noise figure is equal to the gain figure. Local electronics store (Jospeh Electronics) has some professional cable tv low noise broadband preamps, 9 db gain & about 2 db noise for under 100 bucks, seemed like a good deal but I didnt have the cash.

(The R/S Pre-amp'ed portable antenna)...

If you know so much about radio theory, Eric (radio theory being a technical subject), explain how you made the mistake of accusing a Canadian amateur operator of not having a valid callsign?! Were you too lazy or too ignorant to look up the operator's callsign in another database besides QRZ? Even I, a "lowly" unlicensed 11 meter operator, have better sense than to check only one source when doing a callsign search. As a licensed amateur operator, you should be ashamed of yourself.

By the way, Eric, <http://members.aol.com/RazzU/QuietOne.html> is not my Web page--it's my friend's Web page. I am merely helping him publicize his page by posting the page's address for those who are interested in hearing some waves of Frank Burns (one of the most vulgar radio operators I have ever heard) and Howard Lance Kingston. The Phoenix Radio Idiots need to be exposed for what they truly are--vulgar, crass, immature radio operators who exist soley to pollute the airwaves via their antics on 27.365 MHz LSB.

Assuming you are refering to the City of Decatur (not Decatur County),
the police operate a conventional repeater on 852.0125 and the fire dept.
is on 851.0125.
The voice ID you heard was probably "7, 100", where the first number
is the unit calling and "100" is the dispatcher.

I recently got a scanner as a gift, and enjoy listening to all the calls for fire, police, emergency vehicles, etc.

But, I have problems understanding some of the police calls, as I don't know the '10' codes used. If this is the wrong group to post this in, you have my apologies. :)

If it's the right one, can someone maybe email me a list of the '10' codes so that I can understand what's going on?

I live in Incianapolis, I don't know if they're different by city or state, or not.

Thank you for your time,

Jeanette

>>
>> When used voice, it's correctly stated, "SEVEN THREE."

>So if I gave you $73, you would say "seven three dollars?"
>How come "seventy three dollars is bad?"

$73 is a quantity. 73 is a radio code. Totally different in meaning and
usage, somewhat similiar to the usage of public safety codes like "10-4".

He, like the rest of the little whiny babies out there - need to stick to the topic at hand - we don't give a rat's ass about his personal problems with others.

They need to learn that there are many honest questions and concerns on this and other groups - and that these questions and concerns DO NOT INCLUDE THEIR PETTY PATHETIC PROBLEMS WITH OTHERS.

Eric - what little validity you may have once had has been overshadowed by your stupid pointless postings (along with HLKINGSTON, FRANK BURNS, MACKEY, among others...).

TAKE IT SOMEWHERE ELSE. You people provide a GREAT case for the proponents of mandatory sterilization in society.

>:>Usually, 1 watt = 1 mile in AM mode. If you use SSB, it is around 1
>:>watt = 1.5 mile... so 12 watts = 18 miles ?

Ummm....No.

ALL ELSE BEING EQUAL Power needed goes with the square of the change in distance...

double the distance, you need 4 times the power. Triple the distance, you need 9 times the power and so on.

Now given that we live in the real world, all else is never equal, and your results will generally be worse than what I just mentioned. ;)

Unless you're talking between mountaintops, it's pretty tough to make a "local" (non skip) contact past about 20 miles anyway...HF equipment (including CB's) is line of sight (until you get enough range and power to where skip comes in).

Racing Electronics and Racing Radios are both an excellent source of headphones. Ask them about the reccomended type for the budget you have in mind. I have the conventional type,and they work very well. Look for ones that have individual volume controls[incase you want a friend to share the race]

Here at QST Electroincs we have been selling them for only $259.00,
and you pay the shipping. Shipping has been running about $10.00 so
far, from what we have been seeing and have been told we have the best
price anywhere, and more inportantly we have them in stock ready for
sameday shippment.

>antenna splitter.

It is indeed a signal splitter. I have used a simialr device in the
past for just the purpose you describe. It can also be used between
the car radio and almost any other type of receiver as well.

The small adjustment hoels are for a small internalk antenna tuner
where by the VSWR can be adjusted for the CB radio on transmit. This
will also improve reception.

As you haev discovered, performance is dismal compared to a dedicated
CB antenna.

>not....

First, if you want an investment, consider stocks or mutual funds, not
a scanner radio -- seriously.

To caution against buying a scanner because, at some unspecified
time down the road, new techologies may render it useless is
an unrealistic, paralyzing philosophy.

> The scanner flame is flickering in general. If he doesn't mind
>listening to the drying-up of activity as it unfolds (which a lot of
>people don't -- if I'm 70 years old, for example, most communications
>will still be interceptable for the duration of my lifetime, so why
>not invest in good equipment?), great. But it's a path headed nowhere
>fast otherwise.

Nothing is forever. Buy a scanner if you want to scan and enjoy
it now.

I live in the midwestern USA, where tornadoes and severe weather
(accompanied by power and telephone failures) are common. Scanners
are very useful here and several neighbors own them.

I sympathize with listeners whose local governments
have converted to Ericsson trunked systems.
But there is still *so* much activity to scan which will be around
for quite a while:

- businesses, I monitor these often (especially store and mall
security)
- aircraft
- railroads
- ambulances (med frequencies)
- sporting events

>The TrunkTracker does not impress me so much as it should...

>It only
>does Motorola (certain percentage of the market), and only does analog
>(certain percentage of the percentage). The TrunkTracker,

>effectually, is great for monitoring any trunked system implemented in
>the mid-80s to early 90s...

Except for military air comms, the BC235XLT permits its owner
to monitor the vast majority of VHF and UHF 2-way voice
communications systems in current use.

> Unless someone beats the digital obstacle,
>the replacements to these systems will be unbeatable.

When (and if) most voice communications systems become
digital -- and that won't be for years -- buy a new radio or
find a new hobby. Meanwhile, have fun scanning now.

My point is that you can spend time unproductively fretting
about what might happen years off -- or you can exploit the
and enjoy the current situation and adapt to changes as
they arise.

How far away should we expect to be able to receive the 118-136 and 225-400 Mhz ranges when using a hand held scanner from a home in a typical large city?

How much would purchasing a larger antenna extend the range, in comparison to the rubber antennas that come with the scanners?

Anyone have experience scanning those frequencies in Tampa and Clearwater, FL?

Thanks.

Those will work if you cover then with a pair of hearing protectors like
you would were for shooting sports or in a noisy work environment.

You really need to block out the track noise to hear the scanner. Test them
like this. Put them on and drive down the road at 60-70 MPH with the
driver window open and the stereo up all the way. If you can hear the
scanner it should work at the track.
I went to Dover a few years ago with just a full size set of stereo
headphones.. Heard some but the noise was bad!

4578. Midland Scanner xtals ?

Newsgroup: rec.radio.scanner
Date: 1997-06-15 00:00:00 UTC
From: Tom Montgomery <monty55@ix.netcom.com>
Message-ID: <33A46378.45F1@ix.netcom.com>
Source record: 194305

At a flea market today I picked up an older RS xtal Pro 55 and to my suprise a Midland 13-925 Scanner. States on the front that it is a Dual Band VHF/FM Monitor. The back says it will receive 37-43 mhz and 144-173 mhz. Luckily CHP is in the lower freqs as that is what I want to use it for. It can be used in either the car (came with mount) or in home (came with AC cord). I opened it up and there were no xtals. I pugged it in and everything seems to work okay. No burned out bulbs under the pushbuttons and the speaker and squelch worked fine. Does anybody know what kind of xtals go in this one ? And if you do could you suggest a place to order from or if in the SF Bay area where to go to pick them up. I placed the PL7 xtals from the RS in it (the ones I could receive on in the Pro-55) and nothing came in. I assume that the xtals are not RS type then. Any help would be appreciated. I've got a BC 9000 and 3000, but sometimes I just can't pass up the old ones to use to listen to dedicated freqs !!

Thanks

Monty

Geez! Can't ANYBODY on this N/G quote the RIGHT person????

Apparently the majority of those those posting here are either Cop Bashers or Cops on a some kind of macho ego trip. (Both of which I detest)

"You're a Pig.!" "No, You're a drug addict!" (Like children in a playground)

I'm not saying that everyone here is like that. Thank God. But it does seem to be the predominate rule of thumb.

To the cop bashers: *Most* cops are good people with their hearts in the right place doing a job that most of us wouldn't take for twice the pay.

To the macho egotist that thinks that badge makes him infallable... just because...: Wake up! Not everyone who doesn't wear a badge (or disagrees with you) is your _enemey_!!!

Bobby

Great News.

Dan has a new on line catalog. His Catalog has been expanded and list many many

more items than in the past. He also has many quantity purchase discounts listed.

Check it out.

http://www.fix.net/dans.html

Dan has announced that his on line Catalog will be in a continual state of

change. This means he intends to update it on a regular basis reflecting the

latest deals he has to offer and also to take off out of stock or discontinued

items.

Dan is taking advantage of the Internet to quickly get his new offerings out to us.

The days are gone of having to wait for specials or next years catalog to get the

latest listing of goodies.

Enjoy,,,72,,,Jerry...K

4582. MC CLURE/WONG//FRAUD CON.!!!

Newsgroup: rec.radio.scanner
Date: 1997-06-15 00:00:00 UTC
From: TrunkTrackers@webtv.net
Message-ID: <5o1q3sgvu1@newsd-199.bryant.webtv.net>
Source record: 194309
Cross-posted to: rec.radio.scanner,rec.radio.swap,alt.radio.scanner

Hi Folks,

Many of you asked me to follow up with a concluding post re: "BEWARE OF KEITH MC CLURE/JOHN WONG//FRAUD!!!!!"

In brief,

I sent him an AOR8000 UPS COD/CASH. UPS sent me a money order (MO). Keith Mc Clure (Alias John Wong) stopped payment on the MO, shortly after receiving the AOR8000. Mc Clure in addition...cancelled his e-mail account and would not respond to my numeous telephone calls, which I left on his voice mail.

The MO company verified that they sent him a check for the MO amount, as MC Clure had reported the MO as being lost or stolen (FRAUD).

The funny thing is....the MO company sent the check to the address MC Clure gave, but for some unknown reason...the check came back to the MO campany because of a BAD NAME/ADDRESS. (Thanks Postal Service!!!)

Now, the MO company has the $550.00 for the AOR8000 NOT MC CLURE.

So, I contacted the MO company, signed an affadavit of truth....and received my money for the AOR8000.

The bottom line is the following.....KEITH MC CLURE committed FRAUD, he DID NOT get the AOR8000 AND the money...and hopefully will be prosecuted by the law.

What I learned: When sending a payment via money order, use only a US POSTAL SERVICE MONEY ORDER. Reason: A stop payment cannot be placed on these money orders. I strongly believe in Postal money orders for the reason being that they protect both the BUYER and SELLER.

I have recieved my check from the MO company, and I am quite relieved.

Many of you may remember that my father died at the time this incident occurred, as I was out of town when the fraudulant MO arrived.

Well, the receiving of my monies from the money order company, was one of the nicest FATHER'S DAY gifts that I could have asked for.

Thanks For Your Support And Posts,

Joe

4583. Scanners/CB radios/And much, much more.....

Good for you. I hope that the scanner you sold him was not a 2042 with
the insides of a 2035. You wouldn't happen to have his phone number so I
could call him up to discuss how he ripped me off? He does not respond
to any of my E-Mails.

Radio Shack PRO-43 Modifications FAQ
<Last modified December 1, 1996>
<altered sections indicated by * in TOC>

CONTENTS

* 1. Introduction
* 2. Out of the box frequency coverage
3. Which units can be modified for extended frequency
reception?
4. Companies that will modify the PRO-43 for extended
frequency reception
5. The modifications
extended receive 800 MHz (original mod + solderless)
* extended receive 6-1000MHz
keypad beep delete
improved audio
attaching an S-meter
400 memory channels
extended receive (30-68MHz for European model)
* 5. Some fixes
* Unit reset
* Freeing from lockup after all banks deselcted
------------------------------------------------------------
1. Introduction

As long as there is a continuing demand for it, this PRO-43
modifications FAQ will be posted every month or so. In large
part, it is the file PRO43.MOD from pub/hamradio/mods/tandy at
oak.oakland.edu .

The FAQ now includes mods for

(1) extended receive (800 MHz:
original mod + solderless)
(2) keypad beep delete
(3) improved audio
(4) attaching an S-meter
(5) extended receive (30-68 MHz for European model)

There is also a mod for 400 memory channels, but, to quote
its author, it is very complicated, should only be attempted
by someone with moderate to advanced electronics experience,
and is not for the faint of heart or the "weekend technician."
A brief description is included at the end of this FAQ. If
the mod were included in its entirety, the size of the FAQ
```

would be increased four-fold.
---
2. Out of the box frequency coverage

30-54 MHz
118-174 MHz
220-512 MHz
806-823.9375 MHz
851-868.9375 MHz
896-999.9875 MHz
---
3. Which units can be modified for extended frequency
(800 MHZ) reception?

Note: In the United States, it is against the law
(Electronics Communications Privacy Act of 1987, public law
99-508, amended 1994 by public law 103-414) to listen to
cellular or cordless telephone communications. However, it is
not illegal to own equipment that can receive or can be
modified to receive such communications, even though it became
illegal as of April 1994 to manufacture or import equipment
that could be easily modified by the user to receive cellular
communications. Equipment manufactured before the cutoff date
can continue to be sold until stocks are exhausted. While
businesses are forbidden from importing cellular capable
scanners for resale, the question has been raised whether an
individual can legally import such equipment not intended for
resale. The issue is not explored here.

Which PRO-43 units can be modified for extended receive?
The best information is that units sold in the US and Canada
can be identified by the following scheme

Modifiable | Nonmodifiable
|
serial number no A in # | begins with A
FCC-ID AA020-300 | AA020-300A

There have been rumors that the correspondence between serial
number and FCC-ID may not be perfect, that is, there may be
some units judged modifiable by the serial number and
nonmodifiable by the FCC-ID, and vice-versa. Anyone with a
such a unit should send a message to gdallal@world.std.com so
that the information can be incorporated into this FAQ.

Date codes: Inside the battery compartment is a paper label
containing the date of manufacture in the form "month A year".
For example, 5A3 is May, 1993. The cutoff date after which
units could no longer be modifiable is April, 1994 (4A4). So
far, the earliest reported date of manufacture of a
nonmodifiable unit is 3A4 (March, 1994). There have been *no*
reports of a modifiable US 3A4 unit. However, there have been

reports of a modifiable Canadian 10A4 unit; it did not have an A in the serial number.

Until the rumors surrounding imperfect correspondence between serial number and FCC-ID can be settled, it is better to check the FCC-ID. But be careful. All units have A's in the FCC-ID. Only nonmodifiable units have an FCC-ID that ends in A.

THE PRESENCE OR ABSENCE OF A FINAL 'A' IN THE FCC-ID
IS A DEFINITIVE WAY OF DETERMINING WHETHER A PRO-43
CAN BE MODIFIED FOR EXTENDED FREQUENCY RECEPTION.
IF THE FCC-ID IS 'AA020-300', THE UNIT IS MODIFIABLE.
IF THE FCC-ID IS 'AA020-300A', THE UNIT IS NOT MODIFIABLE.

It has been reported that some units currently being made for sale overseas can be modified for extended 800 MHz reception. However, it is not known whether this applies to all overseas units or, if not, whether there is a way to distinguish modifiable units from nonmodifiable units.

The PRO-43 was produced under two brand names. My 3A3 unit carries the Realistic name; my 12A3 unit carries the Radio Shack name. At the moment, it is not known whether this represented a changeover or whether both types were produced side-by-side for a time. It is also not known whether their electronics are different.

There are no software modifications for the PRO-43. It is not possible to extend the frequency range of the radio by pushing buttons on the keypad. Such modifications are possible with other models, such as the PRO-51, but *not* with the PRO-43. The PRO-43, made by GRE (General Radio Electronics) of Japan, is one of Radio Shack's few triple conversion units. Radio Shack scanners with software mods are double conversion units made by Uniden.

Modification procedures for other radios are available by anonymous ftp from the pub/hamradio/mods/<manufacturer> subdirectories at oak.oakland.edu.

There is some debate about whether step (5) of the extended receive modification is worthwhile. According to Bob Parnass, from his "Improved Audio Mod", below:

"Now that I have a schematic, I see that the European version of the PRO-43 has different coils and capacitors in the low (mid) band front end filter. That explains why the 75 MHz sensitivity isn't stellar after adding diode D3 to enable 30-88 MHz coverage."

So, if you trash the diode in step 4 or want to quit while your ahead, don't lose sleep over it. On the other hand,

quoting ray_reese@tscnet.eskimo.com (Ray Reese),

When I purchased my PRO-43 and did the mod for adding 54-88 Mhz, using the removed cell. diode, I wanted to be able to listen to the sound carrier for the tv channels 2-6 as well as the 72-76 Mhz band. It is worth the trouble to make the mode and it does work well in my area, despite not having the correct coils for that band area. Do the mod anyway, but [if you've trashed your original diode], use a 1N4148 fast-switching diode. Perhaps a 1N914 might do the job also. They can be found at Radio Shack for a cheap price.

---

4. Companies that will modify the PRO-43 for extended frequency reception

If you'd rather not do the modification for extended frequency reception yourself, Cellular Security Group, 106 Western Avenue, Essex, MA 01929 (508/768-7486) will do it for $40, which includes insured UPS return postage. However, CSG will not move the diode to extend the low band to 88 MHz; they only remove the diode to unlock the 800 MHz frequencies. When CSG is mentioned on the net, two types of comments follow: testimonials from satisfied customers and comments from those with the technical skills claiming that the service seems high priced for just removing the diode. But, there have been *no* reports of shoddy work or damaged radios. (They've modified two of mine.) Units are processed within 24 hours of receipt.

Grove Enterprises' newly advertised Repair Service will perform the mod for $40 plus shipping. They will move (rather than just remove) the diode in units that can benefit from it, but state that there is no way to tell whether the diode should be moved without looking inside. They claim that the determination can not be made from the serial number, FCC-ID, or date of manufacture. For further details, call Grove at 704/837-7081. In order to get a unit modified, a service order number must be obtained from the same telephone number. Packages without a SO# will be refused.

---

5. The modifications

From: armille@afterlife.ncsc.mil (A. Ray Miller)
Summary: cellular (870-890 MHz) and low band (51-88 MHz) restoration for PRO-43

A few people have mentioned the cellular mod for the PRO-43; it turns out you should not remove but MOVE the diode. Doing so allows cellular coverage as well as low band (up to 88 MHz) coverage.

Acknowledgments to Grove Enterprises; this information came from them.
They are selling the PRO-43 for $300 which is $50 less than Radio Shack.
I have no connection with them other than as a satisfied customer.

PRO-43
Cellular Frequency Restoration and Low Band Expansion

Note: It is not lawful to monitor cellular or conventional mobile telephone conversations.

The following procedure requires familiarity with microcircuit soldering and will violate your warranty. Grove Enterprises assumes no liability resulting from its attempt, nor will accept the modified scanner for return under any condition.

TOOLS NEEDED: Fine point, low power soldering pencil; solder wick or a desoldering tool; pointed awl, hemostats or pointed tweezers; small Philips screwdriver; solder.

1) Remove the battery, antenna and back cover (held in place by four screws).

2) Remove the six screws holding the top circuit board in place. Carefully unsolder the two antenna connections from the board. Bend the antenna ground tab fully up from the board. Carefully lift the board, unplugging the black connector at its base, and lay the board out of the way on its bundle of colored wires.

3) Remove the two screws from the next board and lift it, carefully unplugging the white connector at the bottom of the board. Lift it up and lay it aside on its brown wire (which can be unplugged if necessary).

4) Unsolder and remove the metal shield from the final board, revealing the microprocessor; note the row of diodes labeled D1-D5 above it. Only diodes D1, D2, and D4 are present; assisted by a pointed tool, unsolder and remove D4, the lone diode (this restores cellular frequencies which will be searched in 30 kHz steps).

5) Resolder the removed diode carefully into position D3 to extend low band coverage to 88 MHz.

6) Reassemble the boards, paying particular attention to the alignment of the plugs. Test the radio by entering any frequency between 870 and 890 MHz (cellular) and 51-88 MHz (low band).

From: IN%"savage@dg-rtp.dg.com" 2-FEB-1995 17:55:07.31

BTW, I did something similar [to the mod that follows] but MUCH easier... No soldering, removing antennas, PCBs, etc..

Just open up the Pro 43 and look down on the bottom PCB from where the batteries usually lie. You'll see the diodes there. Simply take an

xacto knife and and break the solder on the D4 diode (left-most on mine) on the side facing you. I just cut back-and-forth for a bit. Once the solder (it's surface mounted) is weak enough, I just bend up the diode a bit from the PCB. Presto. I left mine hanging on the one side with solder. If you continue to work it a bit, you can probably remove the whole diode.

--Ed

From: springel@umich.edu (Jason G. Springel)
Subject: MODing a Pro-43 without soldering

I just purchased a new Pro-43 to replace my Uniden 200XLT after reading many of the praises for the Pro-43 on this newsgroup. I decided to try and MOD it, but don't have a lot of experience with a soldering iron. After examining the scanner's innards, I found it was quite easy to "fix" with nothing more than a minature philips screwdriver and some small needlenose pliars.

********** Standard Discalimer from other MODs:

1-It is against the law to monitor cellular or mobile telephone calls.

*****2-Procedures outlined below [DO NOT] require knowledge of microcircuits, soldering and assembly techniques.

*****3-You will [NOT] need a low-wattage soldering iron, solder and other various tools to help in the procedure.

4-The following procedure will void your warranty.

****
Here is my new MOD:

Step 1

Remove the battery, antenna, and back cover which is held in place by four screws. Place the scanner keypad-side down on your working surface.

Step 2

Remove the six screws holding the top circuit board in place.

Step 3

Using a VERY small screwdriver (I used one from a Radio Shack kit), remove the two screws from the lower circuit board. Looking down at the unit, you will see that the screw on right side of the lower circuit board can be easily removed. Remove the screw on the left side by by sliding the screwdriver between the top circuit board and the metal frame which holds the two boards together.

Step 4

With these two screws removed, you can now lift the entire top panel (antenna, volume, and squelch knobs) along with the top two circuit boards as one unit. The two circuit boards will be connected to the final circuit board (the one attached to the front section of the scanner) by several wires. Simply set the top panel/circuit boards alongside the front section of the scanner and you can leave these wires connected.

Step 5

The microporcessor is located under the large metal shield on the final board (the front section of the scanner with the display and keypad). If you look under metal shield from the side closest to the bottom of the scanner, you should see the row of diodes labeled D1-D5.

Only diodes D1, D2 and D4 should be present.

Use a small pointed tool to break off D4. You actually don't have to remove it completely (unless you want to use it to restore additional frequencies as explained in other MODs), you can just lift one side so it dosen't make connection and then put a small piece of tape or heat shrink over it, so it won't. Make sure it's not lifted to high or the boards will not fit.

This will restore Cellular Frequencies in 30 kHz steps.

Step 5

Reverse the process to replace the top panel/circuit boards and the two screws that connect the lower circuit board. Replace the 6 screws from the top board. Replace the cover, etc.....

...the diode positions on the cpu board, of which only three are filled look like this. Where X equals a diode soldered in place.

D5 D4 D3 D2 D1

O X O X X Normal configuration

O O O X X Cellular modification(D4 removed)

O O X X X Lo-Band modification(D4 in D3's place)

These directions were based on an original MOD design whose origins I do not know. My thanks go out to the original author of that MOD! Hope this helps those of you who do not own a soldering iron!

PRO-43 Shortwave & Extended Receive
Al Mellon N8KLI

ification is only possible on radios able to be modified to receive the full 800 MHz range.)

Scope and nature of the modification: To allow the PRO-43 to receive frequencies from 6 MHz to 1000 MHz. This is accomplished by setting the PRO-43 to non-standard splinter frequencies, the CPU will then step the radio beyond the normal band edges. To derive the non-standard splinter frequencies

it is necessary to change the diode configuration matrix, and to use the monitor-search function. The hardware modification should take about thirty minutes. The remaining programming / search will take as little as 45 minutes (depending on how interested you are in the signals you encounter during the 806 MHz to 30 MHz search to be run).

I made a few attempts to make deals with various radio mod shops. Most felt the time needed to make key pad entries was too long to make a profit.

< This is a lengthy modification. It can be found in its entirety in /pub3/hamradio/mods/tandy/pro43swl.zip at oak.oakland.edu and at http://204.134.124.1:80/kc5kto/pro43swl.html>

From: ross@novax.llnl.gov
Date: 19 Aug 92 16:51:08 GMT

Here is my keypad beep delete mod for the RPO-43:

1. Remove battery.
2. Remove back cover (4 screws).
3. Remove top board (6 screws, desolder two antenna connections and bend antenna ground lead up out of the way). Be careful of black connector at bottom of board. Flip board over and lay aside (wire connectors need not be disconnected).
4. Remove middle board (remove 2 screws and wire connector). Be careful of two multi-pin connectors along underside of board. Set middle board aside.
5. Locate 10 pin connector on side of bottom board (labeled CN3). Note that one end of connector has pin 10 labeled as such. Count back to pin 6 and bend pin 6 ninety degrees towards the large RF shield. Make sure the bent pin clears the RF shield.
6. Reassemble and your done OR do the cell mod since you are so close.

Have fun. Gary Ross >usual disclaimer>

Subject: Improved audio for the PRO-43 portable scanner
From: parnass@cbnewse.cb.att.com (Bob Parnass, AJ9S)
Date: Wed, 2 Dec 1992 01:15:35 GMT

IMPROVED AUDIO FOR THE PRO-43 SCANNER

by Bob Parnass, AJ9S

The Radio Shack PRO-43 scanner audio is too bassy.1 The lack of treble makes it difficult to hear the PRO-43 in noisy situations, especially while listening in a car or truck. Louis Shirley sent me a schematic and suggested I remove C341, a tiny 0.015 ufd surface mount capacitor.

I'm glad to report that removing C341 made a great improvement. The audio is now much "crisper," more like the Uniden 200xlt, although still not quite as loud. Turning the volume control up still overloads

the PRO-43's small, internal speaker, but there's less need to do that once C341 is removed.

The PRO-43 contains 3 printed circuit boards, and the middle (second) board contains the audio circuitry. Finding C341 is difficult, as it is neither marked with a value nor a component designation. It is located on the foil side of the middle board, under IC304, an LM386 amplifier IC. C341 is in parallel with, and physically next to, R350 (33,000 ohm). R350 is slightly larger than C341 and is marked 333. Both R350 and C341 are connected between pin 2 of the LM386 and ground.

A Note About 50-88 MHz Reception

Now that I have a schematic, I see that the European version of the PRO-43 has different coils and capacitors in the low (mid) band front end filter. That explains why the 75 MHz sensitivity isn't stellar after adding diode D3 to enable 30-88 MHz coverage.

---

1. See "PRO-43 Product Review," by Bob Parnass, AJ9S, in the November 1992 RCMA Journal.

Subject: S-Meter for PRO-43
From: schuster@panix.com (Michael Schuster)

Found this on the Fidonet scanner echo:

=====begin quoted text=================

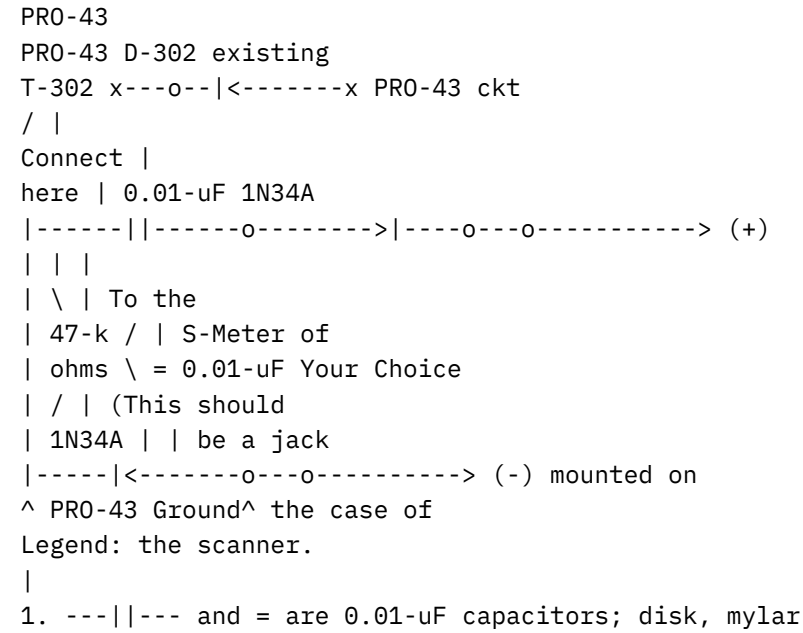
Date: 02-06-93 00:24
From: Bill Cheek
To: All
Subject: PRO-43 S-Meter!

Greetings Scanner Fans!

It had to happen! The fundamentals for an S-Meter exist alive and well in the PRO-43! Only a simple circuit and your choice of meter, analog or LED, is required for a jim-dandy S-Meter function!

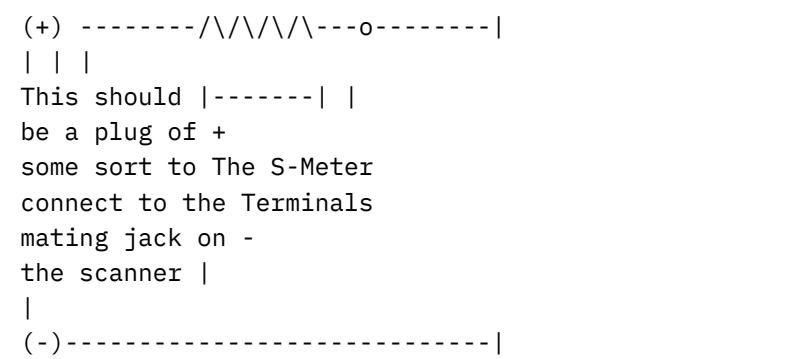
The key point in the circuit is the cathode of D-302 located on the bottom (solder side) of the AF Board (middle board). You will need the Service Manual for the PRO-43 to find it as it's not marked and it would take me 10,000 words to guide you to exactly where it is located. Call Tandy National Parts at (800) 442-2425 to order your manual: approx $10. Now here is the deal:

Locate D-302 and either build the following circuit right there on the back of the AF board in the vicinity of D-302, or solder a wire to the cathode of D-302 and route it to somewhere else more convenient to feed the below circuit. This wire ought not to be very long, though, say not more than a couple of inches. Refer to the ASCII schematic diagram as follows:



PRO-43
PRO-43 D-302 existing
T-302 x---o--|<-------x PRO-43 ckt
/ |
Connect |
here | 0.01-uF 1N34A
|------||------o-------->|----o---o-----------> (+)
| | |
| \ | To the
| 47-k / | S-Meter of
| ohms \ = 0.01-uF Your Choice
| / | (This should
| 1N34A | | be a jack
|-----|<-------o---o----------> (-) mounted on
^ PRO-43 Ground^ the case of
Legend: the scanner.
|
1. ---||--- and = are 0.01-uF capacitors; disk, mylar, monolythic, chip
|
2. --->|--- and ---|<---- are germanium diodes, 1N34A
| is cathode
< is anode
3. o means a connection, preferably soldered
4. The 47-k resistor is self-explanatory, I hope.
5. -------- and | are wires/conductors.
|
|
6. x is existing PRO-43 circuitry

If you use an analog meter, preferably a real S-Meter like salvaged from an old junked CB rig, then rig it as follows to connect to the circuit above:



You can also build the 10-segment LED S-Meter as shown in Volume 2 of my SCANNER MODIFICATION HANDBOOK, available from leading mail order radio dealers everywhere. ISBN 0-939780-14-3 published by CRB Research Books, Inc. Commack, NY.

After connected and working, locate the PRO-43 very near a known strong transmitter, perhaps a ham transmitter, a police cruiser, your favorite security guard's handheld or right next to a cordless telephone, or anything else known to transmit a strong signal. Tune the scanner to the frequency, and adjust the 5-k trim pot above so the meter reads exactly full scale. All other signals will read proportionally lower to yield "relative signal strength" measurements! A hell of a circuit here, boys & girls! Have fun!

Subject: PRO-43 w/400 CHANNELS HERES HOW!

IT IS NOT FOR THE FAINT OF HEART however.

PRO-43 ENHANCEMENT
MEMORY EXPANSION & "FADE-AWAY" LIGHT
Brett Bennett 4/12/94
bbb@kuhub.cc.ukans.edu
Copyright 1994 B&D Electronics All Rights Reserved

INTRODUCTION

The following document details two enhancement modifications that are possible on the Radio Shack PRO-43 scanning radio. The first modification doubles the factory standard memory capacity, allowing you to enjoy an additional 200 channels of memory, plus 10 more monitor memories. After completing the first modification, it is a fairly simple matter to add a 7 to 10 second delay feature to the LCD back-light lamp circuit. I designed and performed these modifications on my PRO-43 and they do work. As I understand it, there (has been/is being) presented in WORLD SCANNER REPORT a similar memory expansion. I have not seen this modification and for all I know it is a better way of doing it. What is presented is a 'clean-room' design of my

own that to the best of my knowledge is the only one to also offer a time-delay for the LCD back-light. Having said that, let me say:

I ASSUME NO RESPONSIBILITY FOR ANYTHING THAT MIGHT HAPPEN TO YOUR RADIO SHOULD YOU OR ANYONE ELSE ATTEMPT THESE MODIFICATIONS. WHILE REASONABLE CARE HAS GONE INTO THE PREPARATION OF THE FOLLOWING DOCUMENT, I CAN NOT GUARANTEE THAT THERE ARE NOT ERRORS.

The procedure described below is very complicated, and involves the soldering and desoldering of very tiny components and the cutting of printed circuit board traces. While the procedure is not irreversible, it will leave permanent scars inside your scanner. It should only be attempted by someone with moderate to advanced electronics experience. I don't think it should be attempted by, to quote someone else, a "weekend technician." If as you read through this you feel intimidated by the jargon and required procedures or if an electronic schematic looks like a strange piece of modern art to you, then this might not be the 'mod' you are looking for. The following document will assume you have obtained the materials listed below, especially the Service Manual, and you have studied the circuit in some detail. I will not describe in great detail where every component is or where every solder point on the logic board should be placed. Having the Service Manual, and having studied the drawings therein will allow you determine to where it is I refer.

REQUIREMENTS

1 - PRO-43 Service Manual. (Tandy Parts # MS-2000300 - approx. $6.00)
1 - CD4053 - Triple - SPDT analog switch - Surface mount package (DigiKey #CD4053BCM-ND - approx. $1.50)
2 - 93C67 EEPROMs (Tandy Parts # MX-8050 - approx. $13.00/each)
1 - 100k x 5 resistor network. Common lead type. (DigiKey # Q5104)
1 - UN2111 PNP transistor (Q1 on Logic PCB. Tandy Parts #)
1 - 1 uF 16v capacitor.
1 - 10 MOhm 1/8-1/16W resistor.
Misc.:
Wire wrap wire-30 gauge. (Radio Shack)
Grounded soldering iron with approx. 1/32" tip or smaller.
Desoldering Equipment.
Digital Volt Meter. (Used to double check your VCC and Ground connections, pre-check switching assembly)
Utility knife with fresh sharp small blade. (Needed to cut traces.)
Strong hand held magnifying lens. (Needed to check solder joints.)
+5-10 Volt bench power supply. (Used to check switching assembly.)
Anti-Static work place and grounding wrist band.
Very fine needle nose pliers, wire cutters.

From: IN%"millingtoj@oldhamlrd-po.oldham.gpsemi.COM"
"John Millington" 17-DEC-1995 04:55:31.71
Subj: RE: pro-43

The European Pro-43 comes with a diode in D1, D3, +D5.
Remove the diode from D5 and solder it in position D2.
The scanner will now cover 30-68Mhz.

Usual disclaimer.

---

6. The fixes

Unit reset (from the owner's manual)

If the keys do not work and the display is random, while
holding down the CLEAR and 0 (zero), turn the power on to
reset the scanner. Note: This clears all the information
Stored in the scanner.

From: IN%"randyrho@nauticom.net" "Randy Rhoades" 14-NOV-1996 00:13:32.24
Subj: Pro-43 Lockup Fix

Several months ago, the unit "locked up". When the radio was turned
on, nothing appeared on the display but the light button worked.
<RS repaired it, snipped>

It happened again.

<RR reports . . . [Before doing this, first try the reset above. GED]>
The problem seems to be in the software. The PRO-43 seems to forget
how to operate if all banks are de-selected. The software prevents
the operator from deselecting all banks but on rare occations this
routine fails. There seems to be no way to recover from this without
surgery. If you know any other way, please let me know.

THE FIX

There are lots of mod articles around describing the disassembly of
the PRO-43 so I'll omit it here. Disassemble the scanner down to
the CPU board and remove the metal shield. CAREFULLY lift pin 3 on
IC 2 so it no longer makes contact with the circuit board trace.
Reconnect the radio module to the CPU board, hold the back cover
in place, and insert the batteries. Turn on the power. The display
will look a little odd, but it will be apparant that the unit is
scanning. Press the number 1 on the keypad until the scan indicator
on the display shows band 1 is operating. Turn off the power and
disassemble the scanner again. Re-solder pin 3, replace the shield,
and reassemble the scanner. It's fixed !

The only trouble with the procedure is that all of your programmed
frequencies are dust. Just reprogram and thank God it works again.

4595. Re: Walt Disney World

I recall reading a few years ago that the Disney parks (and perhaps other amusement parts) actively discouraged people from using scanners, apparently for security reasons. Don't know if this also applied to portable CB and ham handi-talkies or not. I suppose even if this was true, it has probably been made obsolete by the widespread use of cell phones. Did anyone ever have any problems with scanners in the Disney parks???

Hehehe... I feel sorry for you guys! :) I went to Washington, DC. Not
only is it the nation's capital, mobile use of scanners is illegal. I
wore it on my belt for both of the days I was there. It was fairly
obvious, especially if your a security guard. I went into most of the
Smithsonian museums, and even the White House. A few tourists wondered
what the device was, but other than that, nobody cared. However, I dont
have experience in any other states. As for DC, I wouldn't worry. :)

Yes, all I've seen is rumors AND counter-rumors.

I know the TT won't "do" anything but Motorola -- that's why
I said "I hope..." in my original post. I also want
to be able to follow Seattle-King County.

As luck would have it, the day after my original post, I
talked to a DOT employee who told me "Johnson."

Also, "The Ham Station" says they have them (as of Sunday morning).

Thanks for the reply.

Here's a trick if you have regular headphones. Put your earplugs in first - use decent ones, like you'd use if you didn't have a scanner. Then put the headphones on, and adjust the volume to a comfortable level for you.

I don't have a scanner, but this works great when I listen to the radio broadcast during races.

Boy, Wouldn't it make sense if you had a 2035 and a 2042 and wanted to sell one, you could get a lot more for a 2042 then you could for a 2035. But the 2042 is a much better radio so let's just switch the insides and nobody will notice. WRONG!! This might just be the proof I need to have his ass thrown in jail. I will be calling the Indiana PD tomorrow.

For sale Uniden BearTracker BCT-10 "The Worlds smallest Mobile Scanning System from Uniden Bearcat", size wise it's exactly like a radar detector. Features are: Highway patrol alert with strength meter, highway patrol coverage, local police coverage, pre-programmed scanner covers all 50 states plus Canada, 9 level strength meter, instant weather, built in speaker, windshield mount and visor mount. Can see it and read more info at www.uniden.com under scanners. This was a gift so I have original $198.84 receipt and original box and manuals. I don't use this much since my drive to work is short and thats really the most time I spend in the car. Please e-mail or call (512)490-1649 in Austin TX. Thanks!

Greg (using girlfriends acct.)

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 1997 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

One way to roughly estimate a radio's age is to examine the
4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most

recent date stamp.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 11915 E. Washington St., Cumberland, IN 46229. Phone 317-894-3229.

To order a user manual for an Electra/Bearcat scanner from Uniden, call (800)235-3874 extension 2553.

Some schematic diagrams may be obtained from Uniden/Bearcat's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges.

The phone number for repair is (800)297-1023, too. I recommend you call repair before sending the broken scanner. Items for repair via UPS (include receipt if still under warranty) are usually sent to:

Uniden America Corp.
4700 Amon Carter Blvd.
P.O. Box 95002
Fort Worth, TX 76155

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267.

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and
2. a "feature board" containing the microprocessor controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal

chassis. The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

Paul Grohe replaced a failed C98 with a low ESR (equivalent series resistance), high frequency, switching regulator grade capacitor, e.g. a Panasonic HF series capacitor. He also recommends adding a 0.1 ceramic capacitor in parallel with C98.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Failure of IC9, the 9 volt NJM78M09A regulator in a BC800XLT is another cause of a blank display.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal

required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the

two pins with an X-Acto knife fixed the problem.

Uniden/Bearcat BC200XLT Portable
Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there is no audio and the green backlight no longer functions, a tiny transistor may have failed.

Check for a defective PNP surface mount transistor, Q201 (2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC to several stages of the BC200XLT. Its main purpose is to switch off power hungry stages of the BC200XLT when the CPU thinks the NiCd voltage has fallen below a threshhold. That's an attempt to limit the current drain on weak NiCds to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board, adjacent to the black multi-pin connector which mates the Micom and main boards together.

Q201 can be destroyed by a few different causes, primarily, by something in the scanner drawing too much current through it. In one case, capacitor C36 shorted. It's a 220 uF 10v electrolytic, located on the component side of the main board, connected from pin 8 of the audio IC (IC2 NJM386SL) to ground. Capacitor C55 shorted in another BC200XLT. In a pinch you bypass Q201 by soldering a short piece of bare wire between the collector and emitter, but you must first fix the component which caused Q201 to fail.

BC9000XLT: Loss of Sensitivity

John Ward has fixed two BC9000XLTs which suffered from "low sensitivity." He fixed the solder joint where the antenna jack connects to the circuit board. In both cases the tab from the board was on the opposite side of the jack from where the little blob of solder applied at the factory was located.

It was an intermittent problem that depended upon the position of the antenna cable - if the weight of the cable placed tension on the jack in one direction contact was made and the radio worked fine. If the cable placed tension on the jack in the opposite direction contact was lost and so was reception. The gap was barely noticeable.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder
connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier
activated relay inside the BC890XLT wore out. Andy found
the identical relay sold at Radio Shack (part #275-232) and
says the BC9000XLT uses the same relay, too.

HAMFEST/COMPUTERFEST CALENDAR 1997 - NORTHERN ILLINOIS
last updated June 2, 1997 |

o Please report additions or changes to Bob Parnass, AJ9S, office phone: (630)979-5414, electronic mail: parnass@bell-labs.com. Thanks to Dennis Dale, Rick D. Wilson, and ARRL for providing some of the information.

JUNE 1997

Jun 1 (Sun), Princeton, IL. Bureau County Fairgrounds. Free parking. Info: Debbie Burton, N9DRU, 1153 Union St., Marseilles, IL 61341-1710, tel. 815-795-2201 (Usually an excellent hamfest, with sellers from Illinois, Iowa, and Wisconsin. - AJ9S.)

Jun 8 (Sun), Wheaton, IL. Six Meter Club of Chicago. DuPage County Fairgrounds, 2015 Manchester Rd. 7 AM. Admission $5. VEC tests 9 AM - 1 PM. Talk-in on 146.97 MHz (107.2 PL) or 146.52 MHz. Info (708)442-4961 or contact Joe Gutwein, WA9IRJ, (630)963-4922.

Jun 8 (Sun), Orland Park, IL - Giant Computer show, Orland Park Civic Center. See notes at the end of this article.

Jun 22 (Sun), Wheaton, IL - Giant Computer show, DuPage County Fairgrounds. County Farm & Manchester Rds., Wheaton, IL. See notes at the end of this article.

JULY 1997

Jul 13 (Sun), Sugar Grove, IL - Fox River Radio League, Waubonsee Community College, Rt 47 at Harter Rd. 6 AM. Admission $5. VEC tests 10 AM only. Talk in 147.21 (pl 103.5 & 107.2 Hz) Info: Diana, WD9API (630)293-7485.

Jul 26 (Sat), Pecatonica, IL - Rockford Amateur Radio Assoc. (RARA) Amateur Radio and Computer Hamfest. Winnebago County Fairgrounds, about 15 minutes west of Rockford, Il. Talk in on 146.61 MHz, 114.8 Hz PL. This will be in the main exhibition hall with room for tables. Ham Radio Vendors, Computer parts vendors, tailgating, food. Code receiving contest, Throw the Radio contest, Great door prizes. For table reservations contact Mike Anderson at (815)397-4304 or mander5@ix3.ix.netcom.com. For any other information con-

tact Marsha Plasters at (815) 399-9233 or wa9ffl@aol.com or see http://www.rockford.com/rara/index.htm

AUGUST 1997

Aug 2 (Sat), Quincy, IL - The Western Illinois Amateur Radio Club. Eagles Alps, 3737 N. Fifth Street, Quincy, IL 8:00 a.m. to 2:00 p.m. Admission: $3 at the gate, $2.50 in advance. Lunch available. Free tailgating. Dealer tables available for $5, Friday evening setup permitted. Contact N9JF, tel. 217-336-4191, for table reservations. off-site VE testing. Contact NA9Q, tel. 217-224-8526, for testing information.

Aug 3 (Sun), Peotone, IL - Hamfesters Hamfest. Will County | Fairgrounds. I-57 to Peotone exit 327 (east). Flea market | opens at 6 AM. Indoor exihibits open at 8 AM. Admission | $5. Children under 12 free admission. Info, call David | Brasel NF9N, (708)448-0580 or Info-Line at (708)535-AHAM. | Good sized hamfest. Poorly maintained rest facilities. |

Aug 16 (Sat), Franklin, WI - 7:00 AM, C.A.R.S. Crystal Ridge Ski Lodge. Talk-in on 442.200+ pl 100.0 / 146.52 simplex $4.00/$5.00 Radios. Computers. Electronics. Concessions. Door Prizes. Free parking. Free camping. Large Tailgate selling area. Electricity available, $1.00. Contact C.A.R.S., PO Box 325, Franksville, WI, 53126-0325. 414-325-7427

Aug 16 (Sat), Wheaton, IL - Giant Computer show, DuPage County Fairgrounds. County Farm & Manchester Rds., Wheaton, IL. See notes at the end of this article.

Aug 24 (Sun), Woodstock, IL - Tri-County Radio Group. McHenry County Fairgrounds, Rt. 47. 6 AM. Admission $5. Talk in 146.52 MHz. Contact Bob Grosse, N9KXG. Info (voice/fax) (847)658-1678. http://www.angelfire.com/il/tcrg/ (Smaller, but fun fest. - AJ9S)

SEPTEMBER 1997

Sep 7 (Sun), Joliet, IL - Bolingbrook ARS. Inwood Recreation Center, 3000 W. Jefferson St (Rt. 52), Joliet, IL Admission $5. Outdoor flea market on paved parking lot. Indoor reserved tables. VE testing 9 AM - noon, bring original license and photocopy. Talk in on 147.33 (+600 kHz), 224.54, and 146.82 (-600 kHz). Table Info: Ed Weinstein, WD9AYR, (630)759-7005.

Sep 27 and 28 (Sat & Sun), Grayslake, IL - CFMC's Radio Expo 97. Lake County Fairgrounds, Rts 45 & 120. Admission $6. Talk in 146.76 MHz. Info (708)457-0966. (This is probably

the biggest and best hamfest in N. Illinois - AJ9S).

NOVEMBER 1997

Nov 15 & 16 (Sat & Sun), Fort Wayne, IN - Fort Wayne Ham-
fest. Indiana ARRL State Convention. Allen County War
Memorial Coliseum Expo Center. Sponsored by the Allen
County AR Technical Society. Admission $5. Parking $2.
www.pipeline.com/~dagagnon/. Info: (219)484-1314.

NOTES - Computer Central and Giant Computer shows

Computer Central computer shows are held at the College of
DuPage, Main Arena of the Physical Education Building Park
Blvd & College Road, Glen Ellyn, Il. 708-940-7547. $5
admission with card, normal admission $6.00. Opens 9:30 am
- 3:00 pm.

Giant Computer shows are usually held at the Orland Park
Civic Center, 147th St. & LaGrange Rd., Orland Park, IL or
at the DuPage County Fairgrounds, County Farm & Manchester
Rds., Wheaton, IL. Admission is $5. Show hours are 9:30 AM
- 3 PM. To get on the mailing list or get more information,
call (708)974-3123.

REPAIR TIPS: RADIO SHACK SCANNER RADIOS

Copyright 1997 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

Radio Shack has been selling scanners and monitor receivers
under the Realistic and Radio Shack labels for over 30
years. Most of them were manufactured by General Research
Electronics of Tokyo, though many newer models are
manufactured by Uniden.

The date of manufacture is usually printed on a gummed
label on the scanner as well as the cardboard box. A code
of 12A5, means the scanner was made in the 12th month of
1975, 1985, or 1995, for example.

There's another way to date Radio Shack scanners
manufactured by Uniden. The first digit of the long serial
number is usually the last digit of the year of
manufacture.

Another way to roughly estimate a radio's age is to examine
the 4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most
recent date stamp.

Schematics, Owner's Manuals, and Parts Available

Service manuals for most Radio Shack scanners may be ordered through your local Radio Shack store.

If Radio Shack doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267.

Parts lists for recent models are available on line at: http://support.tandy.com/support_electronics/2849.html. Parts may be ordered through Tandy National Parts, telephone (800)442-2425 or (817)870-5600, or through your local Radio Shack store

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

GRE-Built Base Models: Dim Backlight

The backlight in many base models, including the PRO-2022, PRO-2004, and PRO-2005/6 is implemented by an electroluminescent panel, which grows dim with use.

The EL panel used in the PRO-2005 and PRO-2006 is designated EL-501, and is identified by Radio Shack part #10800050. A new EL panel can be ordered through your Tandy National parts (see above) or local Radio Shack store and sent to your home. Radio Shack no longer sells replacement EL panels for the PRO-2004.

Replacing the backlight is an operation which requires care and patience. The service manual has an exploded parts diagram which is helpful in showing how to disassemble the scanner.

GRE-Built Portables: Worn Out Keypads

The keypad on late model GRE-made Radio Shack portables, e.g., PRO-39 and PRO-43, can become unreliable after prolonged use. The best repair is to replace the rubber keypad instead of trying to restore contacts using chemicals. A replacement rubber keypad may be ordered inexpensively through Tandy National Parts or your local Radio Shack Store.

PRO-43: Loss of Audio

Early PRO-43s were built with a 200 mW speaker (mfr's part #EAS-3P123A). The voice coils in some of these speakers have opened, resulting in lack of audio output, though audio is still available from the earphone jack. A more

capable 500 mW speaker is available through Tandy as
replacement (EAS-3P127).

PRO-43: Freezup

If you attempt to lock out all 20 channels in a memory
bank, then scan only that bank, your PRO-43 will freeze up
and be placed into a catatonic state. Use the procedure
documented in the PRO-43 user manual to fully reset the
scanner. This will "break the trance," but all the memory
channels will be cleared.

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1996 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers		
Receiver Model No.	Res-istor Value	Stock Comments
Radio Shack PRO-24	R35	33K replace with 220K. Located between pins 12 and 14 of MC3357 (IC1)
Radio Shack PRO-2002	R197	47K try 220K.
Radio Shack PRO-2004	R148	47K remove R148 or replace with 220K.

	On linear board,
	between pins 12 & 14
	of TK10420 (IC2)
Radio Shack PRO-2022	R91 33K replace 33K
	with 220K.
	Between pins 12 & 14
	on IC-1 MC3361
Radio Shack PRO-2035	100K replace 100K
	with 220K.
	Between pins 12 & 14
	of TK10420 (IC-2)
Electra/Bearcat 220	R75 2.7M may be ok as is
Electra/Bearcat 20/20	R75 2.7M may be ok as is
Electra/Bearcat 250	R66 2.2M may be ok as is

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET groups
rec.radio.scanner, alt.radio.scanner, and rec.radio.info.

rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article discusses the purchase of used scanner radios
and includes these topics:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other

radio hobbyists.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Radio Shack repairs scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series (see US patent 4,011,515, granted 3/8/77). Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Tennelec MCP-1 , Bearcat BC-101 , and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The GRE-manufactured SBE Optiscan (and its Sears clone) required poking or covering a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer Uniden/Bearcat BC3000XLT and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to

specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

Electra Corporation stocks crystals for the Bearcat scanners:

Electra Corporation
11915 E. Washington St.
Cumberland, IN 46229
Phone 317-894-3229

Crystals for Bearcat and other models are available from:

American Crystal Co.
1623 Central Ave.
Kansas City, KS 66102
tel. 913-342-5493

Bomar Crystal Company
201 Blackford Ave.
Middlesex, NJ 08846
tel. 908-356-7787

Cal Crystal Lab Inc.
1142 N. Gilbert St.
Anaheim, CA 92801
tel. 714-991-1580

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

G & G Communications
9247 Glenwood Drive
LeRoy, NY 14482.
tel. 716-768-8151

Jan Crystals
Box #-6017
Fort Myers, FL 33911
tel. 813-936-2397

Monitor Crystal Svc
124 W Walnut St Watseka, IL 60970
tel. 815-432-5296

Short product summaries for over 70 scanner models appear in a separate article, entitled "Scanner Radio Review Briefs." For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass,
Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass,
Monitoring Times, May 1995.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner. The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.]

I am often asked, "How do you find these frequencies?"
This article answers the question in various sections:

Books
Magazines
Government Records
Web Sites
Federal Radio Stations
Radio Clubs
Do Your Own Sleuthing
What Makes Station Identification Difficult?
Examine the FCC License on Premise
Examine the Labels on Radio Equipment
Equipment to Determine Frequency Usage
How Can I Determine To Whom I'm Listening? - An Example
Summary
Addresses

Books

The most convenient source of fire and police frequencies is the Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores for under $13. Police Call Plus is

basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. A few pages of local airport and nonsensitive federal government frequencies are included. Selected business frequencies are listed, too, but without callsigns and other details.

I highly recommend Richard Barnett's 1992 book, Monitor America, published by Scanner Master Corp. A 3rd edition is available from Grove Enterprises for about $30. It is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the Radio Communications Monitoring Association (RCMA), now defunt. Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call Plus, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The longstanding source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is a good

book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and the sensationalistic Popular Communications magazines.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $100 instead.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100.

The PerCon Spectrum CDROM sells for under $30 and contains a handful of fields for every FCC license in the US. However, Public Safety license information contained in the Winter 1996 Spectrum doesn't appear as up to date as in the 1997 Police Call Plus.

Spectrum works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at

http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Web Sites

If you have access to the World Wide Web, you can visit dozens of sites with local frequency lists.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'. (See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a

frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available on the WWW page http://aosc.rpmdp.com and from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are

really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using

call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than
70 old and new scanner radios and monitor receivers.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. This article
describes a few of the FM receivers in my collection, and
other models I've tested. It is not meant to be complete.

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass,
Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass,
Monitoring Times, May 1995.

I have published full length reviews and modifications of
these scanner models in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004

Oct 1990 - Radio Shack PRO-2006

Note: Reprints of Monitoring Times articles are available for $3.00 each plus a self-addressed stamped envelope from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this reprint fee.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features

than any other radio. DTMF reader and RS-232 interface included. Multiple settings for IF and AF selectivity, attenuator, AGC, deemphasis, etc. DB9 RS232C connector. Negatives include low contrast LCD display and difficult user interface. NFM squelch closes slowly, causing noise burst at end of each NFM transmission. Electromechanical relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of mixed band frequencies. Great radio, otherwise. See "AOR's AR5000 All-in-One Receiver," by Bob Parnass, in Monitoring Times, December 1996.

ICOM

R-10: late 1996 vintage (serial number 01048 tested). Shirt pocket size multimode is powered by 4 AA penlight cells. Covers 0.5 to 1300 MHz (minus cellular). NFM, WFM, USB, LSB, AM, and CW detectors included. IF bandwidths are fixed. No 30 kHz bandwidth for satellite or FM military monitoring. Battery saver circuit, with selectable duty cycle. Single VFO and 1000 memory channels. There are 900 memory channels divided into 18 banks of 50 channels each. Another bank of 100 channels used to hold unique frequencies found during an auto store operation. 20 pairs of search limits. Up to 100 frequencies may be locked out during a search and stored in a final bank of 100 channels which is cleared before subsequent auto store searches. Each channel can be programmed with the detector mode (e.g., AM, USB), a tuning step size, an attenuator enable flag, and an 8 character label. CI-V computer interface requires extra cost hardware. 7 segment S-meter. Noise blanker. Good sensitivity. Lighted keypad and display, but keystroke sequences are cumbersome.

Good radio hardware in a handy sized package, but scanning performance unimpressive. Very slow memory scanning at only 6 channels/second. Searches at about 16 steps/second, with little or no worthwhile improvement using the "Signal Navigator" feature in the R10 I tested. Rescan delay cannot be disabled. Can only scan one memory bank or all banks, not a combination of banks. No squelch for SSB or CW modes. See "ICOM IC-R10 Receiver," by Bob Parnass, in Monitoring Times, March 1997.

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception

of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the ICOM user with a very annoying clickety-clack, clickety-clack! For Baseband Audio out, I mounted an RCA jack on the back of the R7100A and connected it via shielded cable to the junction of resistors R228 and R230 on the Main Unit. This point is located in the vicinity of IC15 and X3 on the schematic.

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks of 40 channels although bank sizes can be changed. 100 Auto store and 100 Skip memories but that can be increased by reallocating channels from the conventional scan banks. Fixed and programmable step sizes. Relays clickey-clack while scanning across band boundaries. Triple conversion, First IF is 48.8, 778.7, or 266.7 MHz, depending on band. Second and third IFs are 10.7 and 0.455 MHz. Weak to moderate cellular images starting near 1106 MHz. Rugged construction. External power supply. DB25 RS232C connector. Audio peak filter. Ok scanning and great searching performance. See "ICOM R8500 Receiver," by Bob Parnass, in Monitoring Times, January 1997.

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. See US patent 4,270,217, granted May 26, 1981. LED readout. Good scanner, but tinny audio.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels See US patent 4,270,217, granted May 26, 1981. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite. See US patent 4,409,688, granted 11/11/83 for further insight.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. For a full review, see "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery

pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC230XLT (Uniden): See BC220XLT.

BC235XLT TrunkTracker(Uniden): 1997 vintage. Portable with 300 channels in 10 banks. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. A query feature identifies duplicate memory channels. Very fast scan and search rates. Scans 64 channels/sec and skips empty channels. Service search. Data skip. Triple conversion, 254.4, 10.85, 0.45 MHz IFs. Excellent image rejection and intermod immunity. Fairly good audio. See "The Uniden Bearcat BC235XLT," by Bob Parnass, AJ9S, in Monitoring Times, July 1997 or electronic version at www.grove.net.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. NiCd pack provides about 5 hours between charges. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more

than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Z60: base/mobile sporting 60 channels, but 10 of them are for FM broadcast only. Built in alarm clock, priority, and memory which requires no battery backup. Covers 30 - 50, 88 -108, 118-136, 144-174, 440-512 MHz. Notice that it's not spec'd to cover some important federal bands: 136 - 144 and 406 - 440.

RELM

HS200: 1996 vintage. Very good 200 channel portable. 10 banks. Built-in CTCSS and DCS decoder. Lighted keypad. Duplicate channel detection. 100 frequencies can be locked out from search. Very good audio and strong front end. Excellent internal shielding. Global rescan delay. Covers CB. Fixed modes and step sizes. IFs are 280.2 and 0.45

MHz, and perhaps one in between. For a quantitative test report, see "The RELM HS-200 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1997.

Radio Shack

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-

high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2045: 1996 vintage. Very good 200 channel base/mobile made for Radio Shack by Uniden. Tuning/channel selector knob. 10 banks, selectable attenuator, and rescan delay. CTCSS-capable with optional board. Great Auto Store. Weather alert. Scans and searches fast. Can lock out 50 frequencies during search. Step sizes fixed but AM and NFM modes are selectable. IFs are 380.7, 10.7, and 0.455 MHz. Images on VHF-high band despite high 1st IF. Some intermod on review unit. See "The Radio Shack PRO-2045," by Bob Parnass, AJ9S, in Monitoring Times, February 1997.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels. Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search. See "The Radio Shack PRO-2046," by Bob Parnass, AJ9S, in Monitoring Times, October 1996.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Cellular images throughout the 847.6 - 869 MHz range. Includes power saver circuit, odd for a base unit, which can clip the first part of a transmission. See September 1996 Monitoring Times for modifications.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high

price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-26: 1995 vintage. (Not to be confused with a simple 1985 crystal controlled portable bearing the same model number.) Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-62: 1994 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob

Parnass, AJ9S, in Monitoring Times, February 1995.

PRO-64: 1997 vintage. Good portable 400 channel scanner using up conversion. Replaces PRO-62 and has many more features. Selectable AM/NFM modes but fixed step sizes. 10 search banks which can be cascaded. Auto store saves unique frequencies found during a search. Frequencies can be loaded using a computer but optional interface kit not yet available. Can recharge Radio Shack's optional, monolithic NiCd pack, but not AA cells within the scanner. IFs are 257.5, 21.4, and 0.455 MHz.

PRO-30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

Craig (division of Pioneer)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Sonar

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2516	10	X		yes	yes
FR2517	10	X		yes	yes
FR2525	10	X		yes	yes
FR2526	10	X	X	yes	yes
FR2527	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

Tennelec

Manufactured the first synthesized scanners. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers.

Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place

P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)

dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping
and handling. For an additional $4.00, I will include a
custom frequency allocation histogram, a 0 - 1,000 MHz
"spectrum analyzer-like" display showing spectrum usage by
the transmitters in the map coverage area. Send check or
money order payable to Bob Parnass for $29.95 for standard
or $34.95 for deluxe RadioMap report with histogram.
Include your name, address, and telephone number, along with
center location (nearest intersection of 2 streets, or
latitude & longitude) and mail to: Bob Parnass, 2350 Douglas
Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central
time. For a brochure, send SASE.

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their crystal controlled, transistor Plectron and Motorola desktop monitor receivers. They have now been replaced by battery operated portable pagers, and the desktop models are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. They are desktop models which can be powered from 117VAC or 12VDC with the proper mobile cord. The audio quality of a Plectron P1, Plectron 700 series, and Motorola Alert Monitor is far better than any consumer grade scanner and the sensitivity, image rejection, and intermod immunity is outstanding when aligned properly.

The Plectron and Motorola Alert monitors are single band receivers: VHF-low, VHF-high, or UHF. No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

AC power cords for both types of receivers use unique connectors and are scarce. You can buy them new but it's much cheaper to drill a hole on the rear panel and attach a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. You can also get Plectron repairs and parts from:

Northeast Communications
4 Oak Ridge Rd
Newfoundland NJ 07435
201-697-8804

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

Plectrom SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model UHF VHF-high VHF-low

SM-301 X X X
SM-302 X X
SM-303 X X
SM-304 X X

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) /
10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

I currently have no Plectrons or Motorola Alert Monitors
for sale. I'm hoarding them. :-)

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA.
High level overviews of the following topics are presented:

Why Scanning?
Is Scanning Legal?
What Scanner Should I Buy?
What is a CTCSS and DCS Tone Squelch Feature?
How Do I Determine the Proper CTCSS or DCS Code?
Scanner Antennas
Coaxial Cable Feedlines
Where Can I Buy A Scanner?
Modifying Your Scanner
Scanner Repair Shops
Where Can I Obtain Frequency Information?
Do Your Own Frequency Detective Work
How Can I Use Equipment to Uncover New Frequencies?
Scanner Clubs and Mailing Lists

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,

taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies. It's clear from the discussions posted on the Internet that Americans still listen to whatever they want in the privacy of their own homes despite the laws.

It is illegal for companies to sell or import into the USA recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

The rules define "readily altered by the user" as "clipping the leads of, or installing, a simple component such as a

diode, resistor and/or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip using special access codes or an external device, such as a personal computer."

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations and the AR5000 works well.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. Beware of low cost programmables which can't search. Some of the newer models, like the Uniden SportCat and Radio Shack PRO-2046,

allow searching between limits, but the limits are factory programmed and cannot be altered.

Get a model which covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 50 channel scanner will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate. The $2000 Icom R8500 and AOR AR5000 models are exceptions.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, BC230XLT, and Radio Shack PRO-43 and PRO-60 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites.

Looking for value? At $180 discount price, the 100 channel Uniden/Bearcat BC860XLT base is a good value and available at most Wal-Mart stores. The new RELM HS200 portable performs very well is an excellent value at its $250 street price.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 was replaced by the 1000

channel PRO-2035, which was replaced by the PRO-2042. The portable Radio Shack PRO-64 and PRO-60 are good performers. All five models employ up conversion and are made for Radio Shack by GRE (General Research Electronics).

CTCSS and DCS Tone Squelch Feature

Upscale scanners can be optioned with a subaudible tone decoding squelch circuit. There are two types: CTCSS (Continuous Tone Coded Squelch System) and DCS (Digital Coded Squelch). In simple terms, this feature lets your scanner ignore signals you don't want to hear.

Most land mobile two way radios, except trunked systems, transmit either CTCSS or DCS signals subaudibly along with the voice information. U.S. military field radios employ wider deviation and a 150 Hz CTCSS tone, not supported by most scanners or CTCSS decoders.

There are over 40 different CTCSS codes and you can program a specific CTCSS or DCS code into each memory channel. Using a CTCSS or DCS decoder permits your scanner to open the squelch only if the transmission has a code which matches the code you program.

CTCSS and DCS decoding offers several advantages:

1. Ignore unwanted signals on shared frequencies: It is common for several users to share the same frequency, e.g., my county sheriff uses the same frequency as Chicago Police, located about 60 miles away. I want to hear my sheriff's transmissions but don't want the scanner to stop on or listen to Chicago Police transmissions. This is especially a problem when radio propagation is good, e.g., during a "band opening," when reception range is temporarily increased.

2. Combat intermodulation interference: Helps keep out intermod and image interference from strong pagers and other signals which are not transmitted with a matching code.

3. Ignore scrambled transmissions: Many federal law enforcement agencies (FBI, Secret Service, etc) and some local police agencies employ digital voice scrambling, which sounds like white noise and is annoying to hear. The CTCSS or DCS code is sent only when the station is transmitting unscrambled, or "in the clear." You can program federal frequencies along with the proper code into your decoder-equipped scanner so you won't have to listen to the scrambled mess and only hear their transmissions when they are

unscrambled.

CTCSS also goes by various tradenames: Motorola's PL (Private Line), GE's Channel Guard, and RCA's Quiet Channel. Motorola uses the tradename DPL (Digital Private Line) for its digital coded squelch.

How Do I Determine the Proper CTCSS or DCS Code?

There are a few ways to determine the CTCSS or DCS code transmitted by a station:

1. Use an outboard CTCSS/DCS reader which must be attached to the discriminator output circuitry inside the scanner. The reader has an LCD or LED display which indicates the code when a station transmits. I use a CSI model CD-1 Communications Decoder Unit, an an excellent reader which sells new for about $200. (Connect Systems Inc., Ventura, CA, 800-545-1349, www.connectsystems.com).
2. Many of the ScannerMaster guides, as well as scanner club newsletters, print the CTCSS codes used by transmitting stations.
3. On some scanners equipped with the CTCSS squelch, you can program into memory the frequency of interest. Then you "tune" slowly through all the different CTCSS and/or DCS codes until the squelch opens and you hear the dispatcher talking. This is a slow process and the station has to keep transmitting during it.
4. A slow, brute force method is to program the same frequency but a different CTCSS code into several channels and see where your scanner stops.
5. In some cases, I've actually examined the walkie-talkies I want to monitor and found the CTCSS code printed on a label on or inside the radio.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer these alternative antennas for use with portable scanners:

1. The Icom FA-1433B dual band flex antenna, a thin and very flexible rubber antenna, is slightly longer than a stock heliflex but provides better performance.
2. The Austin Condor is a 12" long rubberized antenna available for about $30. While considerably longer

than the stock antenna and the FA-1443B, the Condor is very flexible and provides VHF-high band reception superior to both. It is not designed to cover the VHF-low band, but will allow reception there at least as good as shorter antennas.
3. The "Thin-Stick" is an 18 inch telescoping antenna for extended range. It is made in USA by Smiley Antenna Co., Inc. and is designed to cover both the 2 meter and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U, e.g., Belden type 8267, has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Be sure it is on sale, as Radio Shack list prices are high and their scanners are offered at reduced prices by mail order discounters.

Discount chain stores like Wal-Mart, Best Buy, K-Mart, Service Merchandise, and Circuit City sell scanners, but

carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove.net

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411. Web page is www.aesham.com

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

For information on "virtual downconverter" modifications, see Steve Donnell's article in January 1995 RCMA Scanner Journal or February 1996 Monitoring Times. Reprints of articles from Monitoring Times are available for $3.00 each plus a self-addressed stamped envelope from:

Grove Enterprises,
7540 Highway 64 West,
Brasstown,
NC 28902. For a free catalog, call (704)837-9200.
Telephone (orders only): (800)438-8155.

I don't get any part of this reprint fee.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company which repairs scanners:

- G & G Communications (telephone 716-768-8151) - (www.iinc.com/ggcomm or email ggcomm@iinc.com or ggcomm@aol.com) This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Repair tips for Bearcat and Radio Shack scanners are discussed in two other FAQ articles.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores. The newest editions contain selected business listings, too, although callsigns and other details are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200, www.grove.net) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning (NatScan) is a national

scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. Early issues disappointed experienced scanner hobbyists, but it now has a good column on scanner modifications and has greatly improved its coverage of east coast frequencies since merging with NESN (North East Scanner News). The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

The Scanner Club is the name of a bimonthly magazine published by Les Mattson. It is a successor to the Northeast Scanning News and is the official publication of The Scanner Club, a not-for-profit club organization. TSC's main strength is local frequency information, including CTCSS codes. Sample issues are $4 each. A yearly membership costs $24.95 and includes 6 issues. Write to The Scanner Club, PO Box 62, Gibbstown, NJ 08027 for more information.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM for $100. In the 1995 edition, fields are different than PerCon's Spectrum CDROM but the data appears to be of the same vintage. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities,

highways, airports, military installations, national parks, etc.

The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Peter Laws administers an electronic mail list read by over 700 hobbyists devoted to scanners and scanning. It's called "scan-l" and for more information, read:

http://www.wildstar.net/~plaws/scan/scan-l.txt

Clay Irving <clay@panix.com> administers a scanner electronic mailing list, called "scanning." To subscribe, send an Email message to: majordomo@lists.panix.com

In the body of the Email message, put: subscribe scanning

All Ohio Scanner Club

- 2 -

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. You can obtain an electronic subscription to the CARMA Newsletter. For more info, see:

http://www.TheRamp.net/shabec/carma.htm

The club's mailing address is:

CARMA
P.O. Box 2681
Glenview, IL 60025

Some CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. There is a $15 annual fee for the BBS. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (630)852-1292.

All meetings are held on Saturdays at locations announced in advance. Meetings are usually held at:

- the Destiny Restaurant, on Rand Road, in Des Plaines,

- Philly's in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook,

- The Great Escape, on Irving Park Road, Schiller Park

and at other restaurants.

Interesting. I just got home, and pulled the antenna off of my TT,
and found the center pin stuck in the socket.

Then I read this message......

<GIGANTIC chuckle> I love your analogy.

Funny how the JBT terminology has applied more to FEDERAL
"law enforcement" as opposed to local and/or state law enforce-
ment officers.

The feds police our local/county/state law enforcement agencies
when they supposedly run amok.

Who gets to police the feds when their agencies run amok?

Unlike public service trunks, the control channels does not
>change frequently, but usually remains on the low frequency in the
group.

Hello all,
Just a little info on military trunked systems.

I am a radio technician in the USMC (17.5 years) soon to transfer
to Twentynine Palms, CA. While there to look for a place to live I
did some preliminary frequency hunting and found that the base has
gone to a trunking system. The Data/Control channel changed every day
for the four days I was there. I started on 413.825 then worked it's
way down with 410.025, 409.350, and 408.125. I also noted voice
traffic on 408.950, 408.175, 408.025, 407.950, 407.350, 407.150, and
406.350. The 406.350 freq was used exclusively for phone patches.
The 408.025 freq seemed to be an input for the range control relay
(output = 408.175).
Trunking is new to me as I usually work with conventional systems
in the 1.6 to 30, 30 to 88, 138 to 144/148 to 150.7, and 225 to 400mHZ
bands.

Best Reguards,
Jerry

Agreed! Now, for the ultimate "power trip" by a "Holier Than Thou"
police force, move to Baldwin County, Alabama. I have said for years
that, were the people in the Baldwin County Courthouse interchanged
with the people in the Baldwin County Jail (I mean the "prisoners"),
there would be no noticeable difference. We would still have a
courthouse full of theives!
Now, please, before you say that I am making this up, get in contact
with me and I will pass along all of the case numbers which are
referred to in this post. Then, you can verify the validity of what I
am about to say.
I just thought that you all might like to know that there are still
lots of areas in our "great" nation that are just as backward as they
have been potraid on television and in the theaters for years.
A couple of years ago, my wife and myself reported the burglary of
our house to the Baldwin County, Alabama Sheriff's Department. This
resulted in nothing more than more repeated burglaries!
Within a month, we found OURSELVES listed on the FBI's 10 most
wanted list for burglarizing OUR OWN HOUSE!
After being "arrested" (more like kidnapped) and held under
rediculously high bonds for some 5 1/2 months, we finally managed to

meet the financial requirements of the bonds (ransom) and left the confines of this "hell-on-earth".
Now, during this time, these wonderful people, who are only interested in truth, honesty, and justice, are telling us things like "We'll take away your children!", "We don't care if you're guilty, just say you are and we won't take your children". . .
Well, to make a long story short, after 5 straight acquitals (some of which the judge through out due to what he called "nonexistent evidence", we are free. BUT GUESS WHAT! Of our 4 children, these bastards actually managed to take one! BY OFFERING TO PAY A RELATIVE OF OURSTO FALSELY TURN IN A REPORT OF ABUSE AND NEGLECT!
We have proof of this! The girl has now come forward and WANTS TO TESTIFY THAT SHE WAS OFFERED PAYMENT FOR THE FALSE REPORT!
But, will Wonderful Baldwin County, Alabama hear it? They surely don't want to!
Any suggestions?

It's true... for diagnostic use only, of course. What you are doing is resetting the phone, then entering diagnostic mode. Works for any of the older flips, and although the reset is different for the 8000 series/Classics (brick phones, in case they're called something else in the USA), the procedure is the same.
Too bad you couldn't (or at least, I don't know how to) modify the phone for SMR... the Officer behind you would have no idea you were listening to him; he'd think you were on the phone... would solve those nasty State Scanner Laws, too.

4640. Re: AR8k verses 235xlt was Re: Trunk Tranker - Is it real? Does It Work?

Newsgroup: rec.radio.scanner
Date: 1997-06-15 00:00:00 UTC
From: Brian Warner <bpwarner@csupomona.edu>
Message-ID: <33A3A6AE.551E@csupomona.edu>
Source record: 194367
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I dont think anyone questions the greatness of a AR8k... But you are definately missunderstood on a point. You stated that the AR8k can record any freq... um, any scanner with a headphone jack can record... you just have a cable go from headphone to your stereo/tape deck's Auxilary In... you can record... The audio signal that would normally go to headphones is sent to the tape deck/stero where it can be amplified, altered and/or recorded. That's pretty simple. So yes, even the poor man's scanner can record freq's.

and to reiterate what was said:
I wouldn't buy a trunk tracker to have nice sound, or 1000 memories... all those memories are for shit, if you want to track a trunkuated signal... sure you can type in every trunk freq on a county-wide system, and then try and hit scan when the signal shifts... but what happens when you hear a police freq say, "shots fired..." and the signal shifts, you hit scan, and you hear the next 20 freq's giving signals... and you wait 20 sec or more on each live channel trying to find that lost freq... by the time you come back to the cop, its all over and the coroner is being called...

Wish I had either a Ar8k or a 235xlt... you guys are pretty lucky to own good equipment.

brian.

Winradio is a very good piece of kit, at least the versions sold here in the UK. *however*, you have to be careful that you have sufficient room in your PC case, as it's much bigger than a regular expansion card. I can't comment further as the example I've seen being used is in my buddy's PC, not mine.
Given the choice of one or the other, I'd buy a scanner mainly because I do a lot of mobile listening. However, I would seriously consider it (along with any similar competing products) as a second rig to keep at home.

I am interested in getting headphones so that I can listen to the drivers at car races, but I was wondering what kind I should get. I have seen "In-the-Ear" type for $55 and they offer a 23 db NRR. Is this enough of a noise reduction? I like the idea of the in-the-ear style mainly because they are easy to pack and carry around.

I was wondering what other people use at the track?

Thanks

Todd

I agree with your post in general. But the operative disclaimer used over and over again is "for quite a while". I think the original poster is really wondering if he should invest in a dying hobby or not. The scanner flame is flickering in general. If he doesn't mind listening to the drying-up of activity as it unfolds (which a lot of people don't -- if I'm 70 years old, for example, most communications will still be interceptable for the duration of my lifetime, so why not invest in good equipment?), great. But it's a path headed nowhere fast otherwise.

The TrunkTracker does not impress me so much as it should. It only does Motorola (certain percentage of the market), and only does analog (certain percentage of the percentage). The TrunkTracker, effectually, is great for monitoring any trunked system implemented in the mid-80s to early 90s. Unless someone beats the digital obstacle, the replacements to these systems will be unbeatable.

Not to be completely pessimistic, I never thought trunking in and of itself would be overcome either. :) The market shows great ability to overcome such things where ever there is demand!

> E-MAIL ME....
>

I have gotten several more requests for information regarding conversion
of Motorola Hex codes to Uniden format and vice versa. It happens that
there is yet another Motorola variant of talk group codes for Type II
systems. These are most likely known only to folks programming or
administering Motorola systems but I've had some questions from just such
individuals. So here are the formulas for those who want to know:

Type II talkgroup IDs come in three flavors:

Motorola 3 digit Hex variety such as A07.
ID Range: (000 - FFE)

Motorola 6 digit decimal variety such as 802567.
ID Range: (800000 - 804094)

Uniden format such as 41072.
ID Range: (0 - 65504)

In the following formulas;

M3 represents a Motorola 3 digit Hex format value.
M6 represents a Motorola 6 digit decimal format value.
U represents a Uniden format value.

The notation Dec_to_Hex(X) means convert X to its Hex equivalent.
The notation Hex_to_Dec(X) means convert X to its Decimal equivalent.

================== CONVERSION FORMULAS =================

To convert Use this Formula
----------------- -------------------------

M6 to U (M6 - 800000)*16 = U

M6 to M3 Dec_to_Hex(M6 - 800000) = M3

M3 to U Hex_to_Dec(M3)*16 = U

M3 to M6 Hex_to_Dec(M3) + 800000 = M6

U to M3 Dec_to_Hex(U/16) = M3

U to M6 U/16 + 800000 = M6

==

Examples:

Convert the M6 format ID, 802617 to U format:

(802617 - 800000)*16 = 41872

Convert the M6 format ID, 802617 to M3 format:

Dec_to_Hex(802617 - 800000) => Dec_to_Hex(2617) = A39

Convert the M3 format ID, A39 to U format:

Hex_to_Dec(A39)*16 => 2617*16 = 41872

Convert the M3 format ID, A39 to M6 format:

Hex_to_Dec(A39) + 800000 => 2617 + 800000 = 802617

Convert the U format ID, 41872 to M3 format:

Dec_to_Hex(41872/16) => Dec_to_Hex(2617) = A39

Convert the U format ID, 41872 to M6 format:

41872/16 + 800000 = 802617

I hope this clears up some of the confusion regarding talkgroup IDs.

Hi Scott. If you want to use a word you invented yourself you really
should define it, otherwise we will have to guess and perhaps be wrong.
So, please tell us what your invented word "alot" means to you. By
default it would mean "the absence of lot", or "not a lot" if it was
a word.

Barry

Brock,

Reading uses the Valley frequencies:

158.760 Fire (Stations 83 & 84)
460.350/465.350 Police (5 CHARLES units)

Greenhills is leasing an 800 MHz SMR trunk system. When/if I find them
with my BC-235XLT Trunktracker I'll let you know.

Incorrect answer. MUZAK (the brand-name background music service) seldom used SCA is my understanding, opting for land-lines or in-store tape systems. The Subcarrier Channel Authorization (SCA) given some FM stations in a market could have a number of uses, including background music, transmitter control telemetry, news, etc. It was only detectable by a special radio with an SCA option. SCA was at 39 KHz offset from the carrier, wasn't it? Still used, in fact.

If you hadn't called, the serial numbers (if you gave any) wouldn't
have beenv recorded. If an officer came across those items, he
couldn't have recovered them and arrested anyone who had them. It's
never a waste to call and make a report. He shouldn't have told you
that nothing can be done. At the very least, the crime is reported to
statistical analysis (if your department does such things) and
resources can be placed in problem areas. Future burglars maybe
caught. Statistical trends are very useful in guessing where burglars
are going to hit next.

Not very fair. It's not unusual for non-LEOs to refer to a burglary as
a "robbery". It seemed like a legit question. I hope I answered it
legitimately. No need for flames (yet?).

I use the "in-the-ear" type and they work fine for listening to the
race on a walkman. I'm not sure if there are any sonic differences
between a radio and scanner chatter that would make them less
effective for a scanner. I love them because they are very lightweight.
Also, I don't want to completely block out the sound. That's half the
fun of being at the track! :-)

Watergate involved acts that are investigated by the FBI. The fact that a burglary occurred while the other crime(s) were committed doesn't mean that the FBI investigates burglaries. Had it been a mere burglary, like some clown wanting to steal the TV out of the room, the FBI would never had been called in. But we all know they wanted more than the TV. :-)

I can't vouch for the quality because this is brand new... But if
you're looking for an aviation-only scanner with the UHF aviation
band, Sporty's sells one for about $150. It is handheld and it only
covers those ranges. Good Luck!

FOR SALE:

Uniden Bearcat 200XLT with the following specs:

200 Channel Memory
10 Banks
Priority Scan
Weather Bands
Search Mode
1 Ni-Cd Battery Pack (does not have false low battery indicator fix)
A/C Charger
Freq Ranges: 29.0-54.0MHz, 118.0-174.0MHz, 406.0-512.0MHz, 806.0-956.0MHz
Special "Mods" - Receives 800MHz Cell Phones
Protective Leather Case
Original Documentation
A good solid unit still in very good shape.

$190.00 including shipping & insurance

E-Mail: LOUL@LUCENT.COM

Thanks,

Lou

TrunkTrackers@webtv.net (Joe Mattern) wrote:
>I welcome your rebuttal's to my NEWS BREAKING POST!

Well Joe, you are going to get it. There is no truth what so ever to your dealers claim. It is an outright, libelous lie, probably to boost his own sales. This rumor has been running around since last summer when Bill Cheek first broached this subject on this newsgroup.

We have been in contact with the Veep in charge of Uniden marketing and all our various distributors (3 or 4) this morning (June 16), and there is absolutely no truth to this rumor at all.

>Today, My local Uniden dealer informed me that their distributor will
>send them NO MORE BC-235xlt 'TRUNKTRACKER' scanners for the indefinate
>time being.

Well let's see Joe has not provided us with the name of his local dealer. Without that we can not verify the validity of your claim.

>I am to understand that Motorola has threatened infringement litigation
>towards Uniden regarding the Motorola technology that the BC-235xlt
>utilizes. Motorola wants a 'piece of the pie' from Uniden because it's
>the MOTOROLA technology that makes the TrunkTracker come alive, if you
>will.

Again another bad rumor. Who at Uniden or Mot did you hear that from? Name names Joe, not conjecture.

>So, QUESTION: Has Uniden voluntarily or legally halted the distribution
>of it's BC-235xlt???

No, again who did you hear that from in Undien? Name a name so that it can be verified by others following this story.

>Remember when you bitched at Kevin B. for selling the very first
>production units for 379.95??? Well, by the time this litigation comes
>to a conclusion, the BC-235xlt TrunkTracker may been a scanner of the
>past for $250-$300, or maybe HISTORY!

Wishful thinking on your part Joe. What axes are you trying to grind here. There is no litigation at all either pending or contemplated. Who told you there was litigation pending? What source at Uniden, Mot, or the federal court system passed that info to you? Again, just another completely unfounded rumor and wishfull thinking on some hobbyists parts.

And any idiot who paid $379 for a 235 got just what he deserved, stiffed. If you folks who paid that much would step forward, I have some land in lower Plaquemines Parish, LA I would like to sell ya.

>Remember, Motorola plays hardball and they play to WIN! (kinda sounds
>like a NIKE commercial, doesn't it ???)

Since there is no lit in progress nor any being discussed, again you have made a false claim.

>Happy TrunkTracking, NOT???

No you are wrong sir. Unless you are willing to name the people who passed this info on to you, I won't and don't believe a word being said. This has been going on for quite some time and this UseNet group has been the one group spreading all the false claims throughout the net. Aweful funny this thread about Uniden being sued keeps coming up over and over and no one at Uniden or Mot have heard anything about these claims of lawsuits.

I think what folks here better worry about is themselves getting sued by these companies over all the hot air that keeps getting posted in this venue.

Unless you can name names of who these allegations are coming from, I treat this type of email like email virus messages, absolutely no foundation what so ever.

Why don't you folks give this thing a rest and enjoy the new toy in your hands for a change. Enjoy the best new scanner technology in the last two decades, the Uniden Bearcat BC-235 XLT.

Have a nice scanning day,

Larry Van Horn
Assistant Editor
Monitoring Times magazine

>anything, on removing the deleted frequencies?

No can do on the LAX frequencies. There is no AM capability AFAIK in
this scanner. I do believe that there is a clip-it modification to
bring in the UHF-TV freqs (or it might be the 70mhz VHF range) at the
sacrifice of more usable US frequencies... not a mod you would probably
care to do.

>I opened the puppy up, but there were just way too many components for me
>to even begin to figure out which resistor to clip (which I assume is
>how you'd handle it on this model...)

One mod you can do, and it is a simple one, is to add six additional
memories (11-16) by clipping a single diode.

Look at the lower right corner of the main circuitboard for the
"PH-015AD Uniden" marking. (The number is as mine is marked.)
To the LEFT is a connector labeled "J5". Below this connector
are two resistors, one diode and a blank slot in the order of
"resistor diode blank resistor". By clipping the diode, you
will change the BC-140 from ten to sixteen channels. [I believe
that placing a diode in the blank slot reconfiqures some frequencies
for either Canada or UK reception. Not desired here in the states.]

CAVEAT: The above mod was done some time ago on my scanner. I don't
have the docs handy any longer and had to open my BC-140
to gather the information above. I believe that the one
diode comprised the only mod I made to this scanner.

> Scanning the Emergency Services and More.

Because there are several different frequency "plans" used by the
Motorola systems. The user would need to tell the radio which one was in
effect for a given system since the channel to frequency mapping is not
one-to-one. It is easier for the user to simply enetr the frequencies and
thereby resolve the ambiguity than have the user try to intuit the
frequency plan in use.

This is one reason. There are some other issues as well.

Greg Knox

This can be made to work essentially as described, but you missed an important point....

This does not create a cellular SCANNER, just a limited feature single channel receiver.

Real scanners can do so much more. This is one factor in the popularity of modifications for this purpose.

No right or wrong, just the way it is.

Steve

On the flip side, why would the normal, average joe or jane scanner user, the intended marketing target for the TT, even care. We wouldn't know the difference if Motorola named talkgroups after cities. <G>

All we really need to know is fire, pd, water company, etc... = 0010, 0008, etc...

ALL,

I RECEIVED THIS REPLY FROM UNIDEN'S MEDIA AND TRADE SHOW DIRECTOR AT 3:45 P.M. TODAY (JUNE 16).

Subj: lawsuit
Date: 97-06-16 15:43:41 EDT
From: Prince, Jill
To: JTWard11@aol.com (JTWard11@aol.com)

Hi John,

I spoke with our corporate attorney this afternoon regarding your question. To Uniden's knowledge, Motorola has not filed any lawsuit against Uniden
regarding the TrunkTracker.

As for the "production halt," I spoke with our executive VP of sales regarding that issue. The BC235 is currently in full production and we are shipping the units as quickly as we can get them into our warehouse. The demand for the product has been so great, we suspect dealers and distributors are running out of stock almost as quickly as they receive the units. We are working to fill orders as quickly as possible.

Thanks,

Jill

Well this is not true if you live here on the flatlands of Kansas. If I
couldn't talk 40 miles on my 4 watt president and super pentator I'd throw

the whole works out, on ssb 60 to 80 is no problem. I live out in the country there isn't anything close to me like high lines or tall buildings. How far you can talk depends on your location, also you need someone to talk to out there, we do out here. I have been in the city like Kansas City, Hell on ssb you be lucky to talk to someone Five miles away. Location has a lot to do with how far you can talk, Also antennas, I just recently put up an Moon Raker 4 now I can really get out there and talk. I really put up the beam so I could shoot skip when it starts comming in this summer. Than you can catch me on the high end. I'm a Freebander too. Gene

Cross-posted to: rec.autos.sport.indy,rec.radio.scanner,alt.radio.scanner

I have had great success with headphones made by Peltor. They fit completely over the ears and reduce the background noise so you can easily hear the race.

The headphones feel warm on a hot day because they do cover the ears, but it's worth it.

You can stop by Radio Shack and get the appropriate adaptor to plug the Peltor headphones into your scanners earphone jack.

Scanning the races is great !!!

Don

In particular, you must compile the original source with a memory
model that uses large data pointers, e.g. large memory model.

You can get a pre-compiled copy that has been known to work from my
FTP directory (including the entire original news post.) Point your
web browser at ftp://ftp.netcom.com/pub/so/source/index.html

Got bad news for you... They do work as I am listening to it right now
with PL77 (10.7) xytals from RS. 42.62 CA Highway Patrol...161.400 WX
A lot of readers sent me the specs for this receiver and sure enough it
takes the same xtals as all the older RS scanners..... humm.....

From: TrunkTrackers@webtv.net
Message-ID: <5o4n1j$47v$1@newsd-199.bryant.webtv.net>
Source record: 194269

Hi All,

I just wanted to thank John Ward and Larry Van Horn for putting this issue to a conclusion.

Larry Van Horn asked me to verify the source of this FALSE rumor. This information (accurately posted) was given to me by an Orlando Uniden Dealer "RAD-COM". Silvana, the company's PRESIDENT accurately shared this information with me. Folks, I had no reason to suspect this information as being false, as RAD-COM has been in business for over 20 years, and has served as a Uniden dealer for several years.

I personally have NO false motives when it comes to speaking about the BC-235xlt.

I enjoy my TrunkTracker thoroughly, and to date have purchased 9. (I am sure Uniden appreciates this!)

Regards,

Joe

P.S. Thanks for the RAD-COM referral, JASON!

NEW Kenwood Reflector!!!

Kenwood is a mailing list (reflector) devoted entirely
to equipment manufactured by the Kenwood Communications
Corporation (Amateur Radio Products Group).

* equipment, accessories
* repairs, modifications, enhancements
* questions, discussions, etc
* buy, sell, trade, swap

To be added to the mailing list, send email as follows:
TO: majordomo@qsl.net
SUBJECT:
BODY: subscribe kenwood

To be deleted from the mailing list, send email as follows:
TO: majordomo@qsl.net
SUBJECT:
BODY: unsubscribe kenwood

To post items to the reflector, send email as follows:
TO: kenwood@qsl.net

If you have questions or need assistance contact: k7on@qsl.net

-----

HomeBrew is a mailing list (reflector) devoted to amateur radio
and electronics experimentation and construction:

* building kits
* scratch construction
* radios, antennas, widgets
* design
* accessories
* station construction
* digital, analog, uP
* repair, modification, surplus

To be added to the mailing list, send email as follows:
TO: majordomo@qsl.net
SUBJECT:
BODY: subscribe homebrew

To be deleted from the mailing list, send email as follows:
TO: majordomo@qsl.net

If you have questions or need assistance contact: k7on@qsl.net

---

Fox_Tango is a mailing list (reflector) devoted entirely
to "vintage" and "classic" equipment manufactured by the
Yaesu Musen Co., Ltd. of Tokyo Japan.

* equipment, accessories
* collecting, restoring, refurbishing
* buy, sell, trade, swap
* repairs, modifications, enhancements
* questions, discussions, etc
* just plain operating old Yaesu stuff

To be added to the mailing list, send email as follows:
TO: majordomo@qsl.net
SUBJECT:
BODY: subscribe fox_tango

To be deleted from the mailing list, send email as follows:
TO: majordomo@qsl.net
SUBJECT:
BODY: unsubscribe fox_tango

To post items to the reflector, send email as follows:
TO: fox_tango@qsl.net

If you have questions or need assistance contact: k7on@qsl.net

---

Mobile-Portable is a mailing list (reflector) devoted to mobile
and portable operation of amateur radio (QRP and QRO, HF and VHF+):

* rigs, antennas, tuners
* installation
* batteries
* generators
* solar and alternative energy
* camping/RVs/backpacking
* laptop/palmtop computers
* portable packet
* roving and mountain-topping
* GPS, APRS

To be added to the mailing list, send email as follows:
TO: majordomo@qsl.net
SUBJECT:

BODY: subscribe mobile-portable

To be deleted from the mailing list, send email as follows:
TO: majordomo@qsl.net
SUBJECT:
BODY: unsubscribe mobile-portable

To post items to the reflector, send email as follows:

SUBJECT:
BODY: UNSUBSCRIBE bitbucket

As we encourage the free exchange of ideas, if you pay for
email service by the byte you may want to consider carefully
before subscribing.

To submit materials:
TO: bitbucket@qsl.net

If you have questions or need assistance contact: k7on@qsl.net

---

bit bucket /n./

1. The universal data sink (originally, the mythical receptacle
used to catch bits when they fall off the end of a register
during a shift instruction). Discarded, lost, or destroyed data
is said to have `gone to the bit bucket'. On Unix, often used
for /dev/null. Sometimes amplified as `the Great Bit Bucket in
the Sky'.

2. The place where all lost mail and news messages eventually go.
The selection is performed according to Finagle's Law;
important mail is much more likely to end up in the bit bucket

than junk mail, which has an almost 100% probability of getting delivered. Routing to the bit bucket is automatically performed by mail-transfer agents, news systems, and the lower layers of the network.

3. The ideal location for all unwanted mail responses: "Flames about this article to the bit bucket." Such a request is guaranteed to overflow one's mailbox with flames.

4. Excuse for all mail that has not been sent. "I mailed you those figures last week; they must have landed in the bitbucket." Compare black hole.

This term is used purely in jest. It is based on the fanciful notion that bits are objects that are not destroyed but only misplaced. This appears to have been a mutation of an earlier term `bit box', about which the same legend was current; old-time hackers also report that trainees used to be told that when the CPU stored bits into memory it was actually pulling them `out of the bit box'. See also chad box.

Another variant of this legend has it that, as a consequence of the `parity preservation law', the number of 1 bits that go to the bit bucket must equal the number of 0 bits. Any imbalance results in bits filling up the bit bucket. A qualified computer technician can empty a full bit bucket as part of scheduled maintenance.

I want to buy one for my wife's squad car, Must be in excellent
condition,
prefer unmodified, but not nessary. Reasonably priced. (ie. No $400
crap)

Thanks
Ed

When you call the police you might get his wife, she is a cop! That is
Ed coxs post above. I delt with bob the one that got riped of by ed cock

and he is telling the truth, He is a very honest person. Tommis

Source record: 194274

thanks for everyones replies and suggestions.

I am running this on a 386-20 sx laptop using dos 6.22
tapped off the discriminator of the scanner & fed into com1 .

My question. If mdtstuff.exe is running, and data signals other than mdt
is being
received, (such as trunk control channels) should the screen remain
blank, or should some random characters be displayed?

I'm not sure if I'm tuned into a MDT freq. I've tried 850 - 869 with no
results,
including 855.875 ardis. I wish someone could post a .wav file of MDT
traffic
so I could zero in on it.

I'm in the NY metro area & Long island. Has anyone been successful here

Has anyone tried "newmdt.exe" (27052 bytes on 2/25/97)?

thanks again

4710. USED POLICE RADAR GUNS FOR SALE

I have a number of used police radar guns available for sale. Both hand held and two piece, X and K Band, moving and stationary. These can be used
for baseballs and other sports, snowmobiles, cars, watercraft and law enforcement.
For a list of the models I currently have available, send me a E Mail for
a prompt reply.
Thanks,
Mark Hartman

Tomas,

I can't speak for the 461.525 (I think someone else already answered that one), but 460.325 is the King County P.D. "North" Precinct main dispatch channel. Better get it while you can as they are now simulcasting on the trunked system and the UHF is going to disappear - perhaps as early as this summer.

My wife and I own the in the ear style from the Freq. Fan club trailer
and are quite pleased with them. Good noise reduction and very
comfortable (they don't squeeze your head like a vise and are much
cooler to wear in August in the heat).

Good Luck!

>suprise a Midland 13-925 Scanner....

Although your new (old) Midland 13-925 scanner lights up
and appears to scan, it's not clear whether it really
receives or is defective. It should work with the same
VHF crystals used in Radio Shack scanners.

I suggest the same crystal sources mentioned by other
scan-l folks, though the simplest way to get crystals is
to order them at $5 apiece through your local Radio Shack
store. You can browse their looseleaf notebook (on
display at each Radio Shack store) which contains the
stock numbers for several common frequencies. Crystals
should arrive at your home in about one week.

The Midland 13-925H/L/M has IFs of 10.7 and 0.455 MHz.
Schematics, alignment info and specs appear in Sams
Scanner-Monitor Servicing Data volume SD-1.

The Sams book shows this crystal info:

VHF high band

crystal = (desired freq - 10.7) /3

VHF low band

crystal = desired freq + 10.7

Crystal type is HC-25U third overtone, series resonant
Tolerance = 0.002% (-20C to +40C)
Load capacitance is 32 pf + 0.0005%
Drive level = 2.0 mW
Resistance (Rs) < 35 ohms
Shunt capacitance < 6 pF

I have dozens of old crystal scanners and monitor
receivers and use many of them daily. Have fun.

Boy, I tell ya, Eric, you are a walking contradiction! In one of your posts wherein you replied to this HLKINGSTON character, you said that his logic was flawed, his arguments were meaningless, and to top it off, you stated that HLKINGSTON was "irrelevant." Yet every time HLKINGSTON posts in rec.radio.cb or rec.radio.scanner, you always feel it is necessary to post a reply. Did it ever occur to you that maybe HLKINGSTON is just trying to wind you up with his posts in these newsgroups? You don't really think that HLKINGSTON is actually Howard Lance Kingston, do you? I just don't understand why you continue to waste your time on someone that you feel is "irrelevant." It's obvious that HLKINGSTON knows exactly what to say to get a response from you and agitate you even more. If I were in your position, I would just ignore HLKINGSTON and move on to more important things. Just a suggestion, Eric.

Rich,

The NJSP use sizecode "O" in both the zero and 4 blocks so that
equates to S-13 for both. This is for Type I. The Marine Police use
000-6 (Atlantic Coast and Inland Waterway) and 000-10 (Delaware River
and Delaware Bay).

Check out my page at http://www.erols.com/jcardani/sjscan.htm

AR-2700 $225 + shipping

Scanner is in excellent condition, computer controllable, frequency coverage is 0.5 - 1300 MHz, less cellular but is cellular restorable with appropriate software, includes antenna, NiCd batteries, A/C adapter charger, car adapter, owners manual and orginal box. Please reply via email if interested.

Okay, here's the deal. I sold him a Pro-2035 about 2 or 3 months ago, and included a Radio Shack antenna that connects to the external antenna jack. I did think it was kind of weird that he didn't ask any questions about it, just said "I'll take it." Sold it to him for $225. Got my check from UPS, everything was cool with me. If I had any idea he was such an asshole, I wouldn't have sold anything to him, and I encourage everyone else to not buy or sell anything to/from him.

Mark:

I bought a RS PRO-60 a few months ago and was disappointed with the default "rubber" antenna that came with it. I live about 40 miles from a major airport, but was not able to pick up commercial air traffic (108-118 MHz) as good as I would have liked. I was able to dramatically increase the reception with a telescoping center-load antenna (Radio Shack 20-006A). It is designed for hand-held scanners and ham radios. By the way, extend both parts of the antenna from the center-load coil for the best reception of aircraft frequencies. I think I can now pick up air traffic probably 100 miles or more away because I am hearing pilots reporting their altitude at "1-1000" (11000 feet).

This problem is universal. And the pin will not
go back in...to stay. It falls out or will just
not seat.

Someone wrote me suggesting the Cell Phone antennae
works better...he said it does with his TT.

Grove sells a few rubber=ducky antennaes but i seem
to have lost that small catalogue-ette.

Am returning the bad antennae to the seller and
expect to get a replacement soon.

Those of you familar with HELLO....a catalogue
outfit selling PHONE accessories...800 number
so information 800 can get you the number and
ask them to send you their catalogue...

One of their covert antennae's i use in my Jeep
for my 800 scanner...will now convert it to the
TT when using it in the car.

:
: Ummm....No.
:
: *ALL ELSE BEING EQUAL* Power needed goes with the square of the change in
: distance...
: double the distance, you need 4 times the power. Triple the distance, you
: need 9 times the power and so on.

Yep. But with a SSB rig, you have essentially 4 times the useable power. So your theoretical range increase should be double that of AM. My experience is that this is pretty close - at least, here in the flatlands.

: Now given that we live in the real world, all else is never equal, and your
: results will generally be worse than what I just mentioned. ;)

Yeah. If you live in a city - with lots of high rise buildings, then all bets are off.

: Unless you're talking between mountaintops, it's pretty tough to make a
: "local" (non skip) contact past about 20 miles anyway...HF equipment
: (including CB's) is line of sight (until you get enough range and power to
: where skip comes in).

Well, 10 and 11 meters is pretty much line of sight. It is not so true for lower frequencies - which have increasing ground wave propogation as the frequency gets lower.

I have no problem with 40+ miles on SSB - base to base. 20 to 25 miles is normal for communicating with a mobile.

Of course, we are not talking about skip here.

WHY ARE YOU YELLING?

What math are you using? Kind of hard to help if your not telling us
what your doing.

Talk group is a talk group, its the same for both motorola and Uniden.
Normally you may see a talk group as a 3 digit hex number, It
actually a 4 digit number the fourth is the type of call that is
normally a zero. Keep this in mind if your converting lets say TG 001
to Uniden it would be 0010 in hex which is 16 in decimal. Motorola
talk group 003 would be 0030 and in dec its 48
I'm sure you can figure out the rest.

Try windows 95 Calculator its does hec binary octal and decimal
conversion.

When determining crystal interchangeability among older
crystal scanners, you must be specific with regard to make,
model, and band.

Crystal information is published in the 15 volume SD series of
Scanner-Monitor Servicing Data books (Photophacts), sold
by Howard Sams Publishing division of Prentice-Hall
[telephone (800)428-7267].

I own several Midland and Radio Shack scanners and posted the
crystal specifications for Monty's Midland 13-925. Radio Shack's
current (10.7) VHF crystals do indeed work.

As a matter of fact, Monty wrote back:

| Oops I accidently put in a UHF xtal, no wonder it wouldn't work. The
| unit works great and is built like a tank. Gonna hold on to this one !!
| I'm rediscovering the oldies and now I look wherever I go for them.
| Thanks for replying Bob..

This was a common error if the program was compiled with incorrect compiler parameters. It also may happen if you try to run under Windows in any way. One of the first exe versions out had this problem, but it was not publicly posted.

The public versions have had this problem corrected for many months.

For the latest public copy see - ftp://ftp.netcom.com/pub/so/source/index.html.

>> > Any suggestions greatly appreciated. If memory serves, when I saw

You won't get this error message if all you have wrong is the /x parm.

Instead you'll get "****************** 0 percent full" messages over and over.

>I tried that with no luck.
>
>Tony let me know if you figure it out. I think we stand a better chance

Well Tim I sure don't remember you emailing me with this question, I think I would have remembered it, as it is such an easy fix.

Anyway, it all works pretty good, except for a few users on older cpu-machines that produce too much noise.

Good luck,
Howard Higgins

4760. Question for the experts ;-)

Newsgroup: rec.radio.scanner

Hi there!

I've got a question I hope you guys can answer. It's about police radar.
My BEL615STiR book says that:
X band is 10.525 GHz
K band is 24.150 GHz
Ka Band is 33.4 GHz - 36.0 GHz

Since a radar detector is basically a receiver listening on the above
freqs, can a scanner be used to scan the above to determine if radar
is in the area? (I'm new to this scanning stuff.) If yes, can you
recommend a good scanner which will pick up the above freqs.

Thanks & Blue Skies!
-Tommy

There is no "orig site".

The program usually known as MDTSTUFF was originally posted to this newsgroup by somebody who called himself lord@heaven.com. You can find it by searching at Alta Vista or Deja News. That's as close to "orig" as I know how to get.

It was posted as C source code, along with a lengthy explanation of what is going on with it. There were two more similar articles, on Motorola trunked radios and on the Mobitex system. I have collected those articles and made copies available along with some related stuff at ftp://ftp.netcom.com/pub/so/source/index.html I am not the author of the program, and that is not an "orig site."

Hi Tom,

I'm not exactly an expert but I can answer your question. Scanning receivers don't operate even CLOSE to that range. A standard receiver operates around 10mhz - 1ghz, depending on the unit. Even if the scaner could be tuned that high, it would not be in a standard format like FM, and even it was, it probably uses a wider bandwidth than NFM (narrow FM) or WFM(wide FM). Point is, you're not going to buy a RS scanner and listen for police radar! :)

HI Chuck,

No, the RS freq counter isn't going to report the CTCSS tone. The fre q
counter will simply list the frequency that transmit in the 'near field'.
It doesn't actually 'demodulate' the signal on that frequency though.
So It doesnt know if there is a 250.3hz signal or a 1005hz frequency on
there.

I bought a Scout to use with my AR8000. It was so bad I returned it
(the Scout) for a refund. For many low power signals, I'd have to put the
Scout's antenna right against the transmitter's antenna. One the road, I
mainly picked up signals in the 800 and 900MHz range; cellular rarely, and
cordless phones never.

I was at the Hillsboro Oregon airshow this past weekend. The Blue
Angels were there, and I was able to monitor them on several
frequencies. Below is a piece of e-mail I received from the net
with a bunch of frequencies for the Blue Angels. I've put
'**' in front of those frequencies where we heard something just before
or during
the Blue Angels' flight. '*' is other frequencies where the scanner locked
on sometime during the days the airshow was in town, but I can't
confirm it was the Blue Angels.

Happy listening!

Regards, Mark.

The old Alpha and Bravo VHF channels are probably totally out of use. It would be AM mode if present. All UHF stuff here is AM Mode. Ground crews love their new radios and use them quite a bit, about 1/2 scrambled last year. Some use at remote sights. There should be at least 3 other freqs active on the ground crews radios, so keep searching. Also check show / platform control, tower freqs and other area air traffic. I'd start searching the 225-400 Mhz military band a day or so before the show as the Angels will be up spotting the show, giving media rides, etc. Please post Blue Angels Airshow Freq Info what you find active the show.

Hi Rave,

You've got to be kidding? 8 miles? I'm not sure if you live in a rural area, but Im sure that in suburban Pittsburgh, the signal MIGHT go 8 blocks, let alone 8 miles.

This fast food stuff is really low power.

I suppose it depends on the type of receiver equipment, altitude, etc.

In Los Angeles, the T-band allocation of 482.00625 thru 484.99375 is for base & mobile units in the Public Safety service. In the T-band the repeater input is 3 MHz higher (i.e. 485-488 MHz). Scott's description corresponds to portable units operating half-duplex ("simplex") on a tactical or talk-around frequency.

Selling R7100. Original owner, non-cellular blocked. This radio has less than 10 hours of use on it. It is mint, as new. I'm selling it with an Optoelectronics interface which connects the R7100 to a PC. In conjunction with included Scancat Pro software, one can automate control of the R7100, build active frequency databases, etc. I'm selling all as a package for $1050. I prefer pick-up here in the NYC area, but can ship. If interested, e-mail: bonesigh@interport.net

And now, the correct answer.

Yes, it is possible. You need to connect the low pass input of the
counter directly to the NBFM discriminator output inside the scanner.
A filter capacitor may be needed for totally reliable operation. When
connected in this way, ANY frequency counter that can read out audio
and subaudible frequencies CAN BE USED to find CTCSS tones.

Forget cordless phones. There power is way too low unless the Scout is within an inch or two (depending on the antenna you are using for it). Otherwise, I have had good experiences. Most people do not realize that you do need to be fairly close to the source for a hit. Cell phones can be picked up just driving down a street. Paging systems (a strong tower) can register a hit at over a mile. It all depends on the amont of "background" radio noise. The Scout works on picking signals that are 15?db above the background radio noise. In a city, this can be fairly high,which means you need to be closer to the transmitter. If you know you can get fairly close to the transmitter it is well worth the money.

>

Er, ah <G> I think you guys are expecting the wrong thing from a freq. counter. It only finds freqs a certain distance above the background noise. The "background noise" includes broadcast stations, cell sites, cable tv leakage, etc... Antenna is VERY, VERY IMPORTANT, you must use an antenna that focuses on a certain freq. range, and is almost deaf to others. A good all-around scanning antenna is frequently junk on a counter. A _good_ broadcast FM notch filter helps immeasurably.

Low power signals like cordless phones, and drive-thru headsets can only be picked up from about 8 INCHES! <G>

Opto tells you all of this in the manual. With the broadcast filter, I can get a typical public service walkie talkie from about 600 yards. (with a vhf OR uhf antenna), without the filter it's about 100 yards.

Vehicle mounted radios and towers with just a few antennas are easier to get.

Park next to an antenna farm, and guess what? You may get NOTHING. Why? The RF floor is so much higher due to there being many active freqs at once. You have to think of the RF spectrum as a graph, the higher a transmission would stand out from the floor, the farther away you'll grab it.

I've picked up walkie-talkies at airports, railroad yards, malls, fairs, etc... You usually need to SEE THE USER to grab the freq. It will not just sit there and pull in freqs! <G>

I've also had it hammered by pagers. <G>

Like any piece of gear, a freq counter like a Scout needs proper operation to be effective, but IT IS an awesome tool when used correctly after some practice.

Depends what tfc you were hearing on it.

Canadian Airlines at the Vancouver Int'l Airport uses it as an input to their rptr on 461.6375. If you have the BC Emerg Freq Dir, the output is listed under Airports, Vancouver Int'l.

Richmond General Hospital used to use it as a paging freq; this may no longer be true.

You own it! The BEL 615STiR is a good "scanner" for the RADAR freqs!

A scanner range is usually 30-1000 MHz, 1000 MHz is 1 GHz.
Radar is in the 10s of GHz range. Yes a RADAR detector is a "scanning"
receiver of those freqs! actually it's a wideband receiver not a scanner.
You can scan the local police freqs and if you listen to what is going on
you can tell that RADAR is being used in an area. Here a 10-70 is a MV
stop. Knowing that, if I heard a few MV stops in the same location over a
hour or so, I would think that would be a place where a speed trap was
operating.

But that is if the officer is stationary. If he is "rolling" and stopping
cars every few miles along a hiway you could assume the same.
It's eaiser to read the radar detector than it is to tell what is going on
with a scanner when on the road!

Speaking of having to see the user to obtain the freq...

A few years ago, my freq goup was trying to nail the Guardian Angels in Vancouver, BC... but they just didn't want to talk over their radios (we later found out that the radios are used only for emergencies). We ended up following them to a Denny's Restaurant, where everyone (us and them) went inside. After about 1/2 hr of no radio talk, our "frequency weasel" went over to talk with them, Opto counter in hand. He told them that our "instrumentation" was receiving interference, and he wanted to check out their handheld radio to see if that was what was causing the problem. Naturally, being radio illiterate, they handed him their radio... As he held the radio, he made sure he was pressing the PTT... heh.

Some of those IMTS telephones might make nice mobile repeaters. I just gave away two Motorola Mark 12 mobile repeaters that will likely see amateur service. The Mark 12 repaeater was basically a conventional mobile phone without the phone "smarts". Worked full duplex at about 10 watts.

I guess the guys I gave these radios to are expecting to be able to move them down about 20 MHz for use on 440. We'll see.

It is like starting a new unit of measure that's why I have a beef.

After all It is a Motorola system that the scanner is designed to
monitor so why not stick with the standard?

It IS easier to follow hex talk groups then Decimal. Trunking software
and radios are based on Hex talk groups also follow a pattern but try
and figure it out in decimal and it get confusing.

> Knowing the by god Motorola hex code is only usefull if you have

Disagree, the trunking systems talk group are referee to as hex numbers
everywhere. Uniden has made you think in decimal. If you had the
option I'm sure you would agree.

> Could it be that entering a numeric number on a standard numeric

What a shame. I agree. It may be easier to physically enter the info
but its confusing. Guess it was a design problem.

> To program talkgroups into scan lists, you would

Maybe another key stroke but far less headache I'm sure an extra row
of buttons would have served may purposes. All these changes I'm sure
would have brought up the price quite a bit. Would have been nice to
add a alpha numeric display.

Just my $1.00 worth.

4806. Re: Trunk Tracker question about channel assignments

Newsgroup: rec.radio.scanner
Date: 1997-06-17 00:00:00 UTC

Message-ID: <5o5tjt$ncm@newsb.netnews.att.com>
Source record: 194134

assuming one has performed error correction, there is really no
TECHNICAL reason to require all frequencies entered. this can only
mess you up if you don't know one of them..... Using trunker.exe-based
code
it can be demonstrated that you can grab on to the data channel,
suck out the data about what frequencies are in use, and scan...in
fact, in less than a second from finding the data channel, one can be
listening to the
first allocated channel! no typing needed!

If one does not trust the error correction codes etc to guarantee accurate
frequency numbers, one could 'filter' the results and make sure that
the assignments fit the 'pattern' (e.g. the frequency is used in the
round-robin
sequence
several times around. if not, one could discard the errant frequency.....)

Without this capability, it is more involved to find out how a given
trunked system is laid out. If you know the data channel frequency,
you can look up who is assigned that frequency in the FCC database,
use the callsign to find other frequencies assigned to the same user,
presumably for the same trunked system, then key all of them in the
scanner. With trunker.exe, (although it is clearly not portable, but
demonstrates what COULD be done in software inside a portable) one needs
only to latch on to the data channel, sit back, and watch & listen. Once a
whole
cycle has occurred, you will then know the frequencies used for voice.
Within
15 minutes, the CW ID frequency, which in some systems is NOT used for
voice, will be known
as well, and you can even hear the callsign. The only frequencies NOT
exposed in
this way are the ones not actually used for trunking, such as mdt, but you
do have
the callsign, assuming you can decode CW...

Again - this is a concrete, realistic demonstration of how a 'trunktracker'
competitor
could be better! don't think I'm proposing carrying a PC around with the
scanner...

NRF

>Because there are several different frequency "plans" used by the

-> using. Why not tune this in? Anyway so I'll ask again, why does th
-> radio then not just tune into the control channel then tune in a chan
-> assignment and jump back when finished. All Trunk Radios do this.

Because the TrunkTracker is only a SCANNER, you bloody Wank!. if they'd made it assign it's own frequencies also, it would have been a Spectra, AND cost about twice as much. Which wouldn't have sold nearly as well.

4809. *** Your Scanner Opinions Wanted ***

Attention All Scannists,
In an effort to provide everyone with the best knowledge available for purchasing a scanning radio, antenna, book or piece of software, I have created a User Opinions page. This page exists for you to post your personal reviews and thoughts of scanning related items.
I ask each and every one of you reading this message to consider the knowledge and experience you have gained from your monitoring and put it towards helping this effort.
No one expects a thesis to be written. Just your honest comments on what you do and don't like about a particular product. It can take but a few minutes yet make such a large impact to those of use who will make use of it.
To anyone who has ever used the Internet to do research before making a purchase, I think you can see how valuable a resource such as this can be.
Several people have already been unselfish enough to post their thoughts about items they have used. I thank you and hope that others will follow your lead.
To learn more, point your web browsers to

http://www.qsl.net/n2mca/OPINIONS.HTM

Thank you for your time and consideration!

Strong signals,

Does anybody know how to disable the "low Battery" beep on
this scanner short of taking a hammer to it?
The scanner works very well for a long time after the beep comes
on and it is very annoying.
I could not find a threshold adjustment and so I assume there are
internal components that can be "snipped" or modified?
Thanks!
Chuck

What I find interesting is the total lack of the required
testosterone which would allow you to have the courage to ask for the
specific case numbers concerning these COURT DOCUMENTED events.
What better records to use against them but their own.
Or, perhaps you are one of "those" who would choose to say "Oh, I
just know that this couldn't be real, so I won't even bother to ask"
and (by doing so) appease yourself with the knowledge that you never
saw any evidence to back up these statements (due to your own lack of
desire to see the evidence). And IT IS VERY REAL!
I can tell you the truth, but, for _intentional_ ignorance, there is
no cure.

>that the FBI investigates burglaries. Had it been a mere burglary, like
>some clown wanting to steal the TV out of the room, the FBI would never
>had been called in. But we all know they wanted more than the TV. :-)

Ours was not a "mere burglary"! It was an attempt at something MUCH
MORE on the behalf of the Baldwin County, Alabama Sheriff's
Department... BTW, when we finally were able to locate most of our
property which had been stolen, it was in the possession of an
"informant" who was "employed" by the Baldwin County, Alabama
Sheriff's Department. Now, the question is: If they had an "informant"
steal our property, why accuse us of stealing our property? They can't
have it both ways! And, even if I did decide to steal my own property,
something tells me that I would probably wake up during the act and
give myself permission to take my own belongings.
Again, it goes back to those items which (without having seen them)
no one has a right to comment on: the OFFICIAL COURT RECORDS! I prefer
to let their own documentation be the most damning peice of evidence
against them. If you lack the desire to see the proof, then _PLEASE_
do not pass judgement.

I have a radio shack PRO-2026 scanner modded for cell, with manual, mounting brackets, etc... it's in perfect condition, I just have no use for it anymore, I use my handheld everywhere instead...

if you don't know anything about this scanner it picks up the standard radio shack bandplan (up to 956mhz), some of these can be modded for cell, this one is. it's made with the idea that it can be used as a base station scanner, or a mobile scanner. has hook-ups for external speaker and power supply. this scanner has a power jack instead of just 2 wires coming out. it also came with a cable that's fused and has bare wire on one end and the power jack on the other. I have that, although I shortened it for use in my car. lighted display, fold-out stand. quick access weather, fire, marine, police, emergency etc...

if you need to know anything else please e-mail me, I'd be happy to answer any questions. this scanner is 250 new, make an offer. I will ship.

It isn't possible to e-mail this spammer since he's falsified most of
his headers. The spam was actually posted from MCI, not ibm.net,
there is no photoagent user at ibm.net. Check the Path: and
NNTP.Posting.Host: headers ,which the poster does no control, and
you'll see what I'm talking about.

Unfortunately the only way to get rid of this kind of spammer is to
report it to the ISP and hope they can figure out which of their users
is actually doing it.

In this case I believe MCI has finally located this user and
deactivated his account. But he will probably show up soon at another
ISP, he was using earthlink 6 weeks ago until they booted him.

> brain waves that each of us emits. These are the signals that psychics
> decode during their tv shows. The writer was probably picking up his own
> signals. I have to break my silence to warn you. These emissions are NOT
natural. The US government in cooperation with the New World Order, the
power hungry Canadian expansionists, and AmericaOnline, have implanted a
transmitter in your jaw that reports your thoughts to the black
helicopters overhead. They install this at the dentist's office, under
the guise of "scraping tarter from the gumline". They need to replace
the alien power supply for the transmitter at least once a year, hence
the constant checkups.. Those in their adolescent years (the prime years
of disobedience) often have special devices installed, jokingly called
"braces" within the government. Appearing to control tooth growth, they
can receive transmissions directly from the canadians causing disabling
jaw pain to anyone disobeying the upcoming world rule of Chelsea Clinton.
I am able to post this without their knowledge because I have
removed my transmitter. I disabled it with with a suprise blow from a
hammer, which then allowed its removal, along with several teeth and
pieces of bone. I would recommend this procedure to all freedom
seeking individuals. If your friends refuse, do it for them anyways.
They will thank you later.
I will explain the use of dental x-rays later, as it would only be

erased from your minds and probably replaced with pro Bill Gates/Microsoft propoganda. I will be posting under an assumed name, or perhaps ham callsign.
I must go now. The x-files are on, and if I do not decode it properly I may miss the part where Chris Carter explains that "The truth is really not out there".

4830. FS: Pro-43 modified for cellular.

Newsgroup: rec.radio.scanner
Date: 1997-06-17 00:00:00 UTC
From: Michel Morin <morinm@207.35.13.6>
Message-ID: <01bc7ac3$93540620$147797cd@morinm.hip.cam.org>
Source record: 194208

Hi there all
I have for sale a Realistic Pro-43 scanner modified for cellular reception. It is in mint condition with the manual and original box. I am asking $200.00 U.S. for the beast and since I live in Canada, I cannot send C.O.D. to the U.S. Other arrangements can be made. I just sold ham radio equipment to U.S. hams and I simply sent them the stuff on reception of a money order made out in my name. I will be taking bids for some time and YES, I agree to pay for shipping. Hope that answers all questions you might have. If you want to know if the price is negotiable, it depends on the offers I get.

73 de VE2CJW, Michel Morin.

4831. AR-2500 Repair help needed

Newsgroup: rec.radio.scanner
Date: 1997-06-17 00:00:00 UTC
From: bryan@mohr.com
Message-ID: <33a655b1.457300725@nntp2.ba.best.com>
Source record: 194209

I've got an AR-2500 that does not want to pick up any NFM broadcasts anymore. About a year ago it started having trouble picking up the local police in NFM. I changed it to use WFM so that I could still pick them up. The calls are coming through great when the mode is set to WFM still, but obviously this causes some other problems such as:

2 or more calls coming through at the same time
Station identification is pretty difficult

If anyone knows of anybody in the San Jose, CA area that will repair the radio (without "fixing" the cellular in the process), please let me know A.S.A.P.

Source record: 194212
Cross-posted to: rec.autos.sport.indy,rec.radio.scanner,alt.radio.scanner

at a recent race at PIR (Phoenix), I took alonmg a scanner and some sport phones, these have ear clips and are designed for use by joggers. I was able to hear the scanner with these, I just turned up the volume. I guess, I could have usd a pair of ear muffs to help dampen some of the track noise...was ok as long as there were not cars going by right in front of me.

with my AOR 1000 channel scanner, I had plenty of room to store many of the frequencies I found while searching the 450, 455, and 461-469 as well as 851-869mhz areas.

I have a database of racing frequencies. i loaded some of these in the scanner prior to going to the track.

10 codes, ther eare some national standard codes, however, 10-codes
usually are regionalized...they often differ from one agancy to the
next...
example 10-15 papers/package for one agency,
prisoner/in custody for another!

some aare probably phone patches, while others are IMTS phones. If you look at the frequency allocation, you will find IMTS (and paging) in the 30mhz, 152mhz, 158mhz, and 454mhz areas!

IMTS Improved MObile Telephone Service:)

For the sale price of $200, this radio is a good buy. While not the
most sensitive or fastest, it is a good, solid package with wide
frequency coverage and triple conversion. For a first scanner it is
a great buy at this price. With a little bit of effort, you will be
amazed at the amount of information that is out there for you to hear
24 hours a day.
While you are at Radio Shack, be sure to pick up a copy of Police
Call Plus. Contains great frequencies for your area as well as good
background info for those new to the hobby. You'll also probably
want to pick up an AC adapter for when you use it at home to save
your batteries for mobile use.
If you have further questions, stop by my web page listed below
and feel free to e-mail me.

I recently bought an AR8000 and I'm considering purchasing an Opto Scout to reaction tune my scanner. What I wanted to know is what type of experiences people have had with the Scout/AR8000 combo. I have an Opto Interceptor and I wasn't to thrilled with the near field tuning ability. Maybe I was expecting to much from it. What I wanted to know is, what is the typical range for interception of cell phones, police radios, and cordless phones? Not that I ever listen to those things!:)

Thanks
Jose

4850. FS Scanner - $50

Newsgroup: rec.radio.scanner

Source record: 194228

Hi there! I have a Realisitic PRO-42 (Radio Shack) handheld scanner for sale. I'm asking $50 for this baby (I bought it for $80 on clearance 2.5 years ago). It's in mint condition. I may have used it 10-15 times. It's just collecting dust, and I need the cash to buy an HT-202. It has a few minor scratches in the front (you can hardly notice them). Just beeing honest. I used to place it "face-down" on the shelf. Other than that it is perfect!!! I bought this with the intent to use it with a RAMSEY-KIT to listen in on Cellular activity. Their kit is about $50, and it lets you listen in on cellular conversations.So if you combine the two you have one nice combination. I live in Philadelphia, PA.

Specifications: I don't have the box, or instructions, but it is SIMPLE to use! It is 10-channel programmable. It has a phone-type keypad, which allows you to "plug in" the frequency you want. It has a FULL frequency LCD display, and built-in light. Frequency coverage: 30MHz-54Mhz, 138Mhz-174Mhz, and 380MHz-512MHz. Again, you
may add a kit like the RAMSEY-KIT (SCN-1) and be able to receive cellular. Take a look at http://www.ramseyelectronics.com/prod05.htm" for more info.

Sorry if this is a long message, but some people might be interested in this info. By the way, S&H will probably be around $7.50 including COD charges (I'll have to check) Thanks!

There are no traffic helicopters covering D.C. Metro Traffic has three
fixed-wing aircraft. Shadow Traffic has (I beleive) one fixed-wing,
which is the one you hear on WMAL. You'll get the best traffic reports
from Bob Marbourg on WTOP...the Metro planes rely on him for "ground
control" !

WHAT THE HECK ARE YOU TALKING ABOUT!

All that is need is the control channels. The frequency
information, talk groups. radio id's and more is all given from the
control channels. Surely you must have at least looked at the simple
program that was posted to this newsgroup before. It was called trunk
tracker and many newer versions have been going around including
interfaces to radios. It showed channel assignments that was decoded
from the control. It actually showed the frequency that a talkgroup was
using. Why not tune this in? Anyway so I'll ask again, why does the
radio then not just tune into the control channel then tune in a channel
assignment and jump back when finished. All Trunk Radios do this. No
radio has to have a list programmed into it for every system. Just the

control channels. Why Uniden? The scanner MUST already know this because it doing some type of comparison and checking if the frequency was programmed or not. It already knows where to go to. What was the legal issue that made them do it?

Again no frequency plan is needed in any case. All the needed frequency information is contained in the control channel. Uniden is already using this information. Could they not decode it accurately and had to compare it to preprogrammed radios? Do they need some help?

Just seems like a very stupid way of doing things. Maybe next time...maybe they will even think about what their saying in the manuel before printing it. I'm sure they can use some help with all the errors and or incomplete information.

I think I'll hold off buying one for now.

386, 486, or Pentium processor
4MB of Ram
$65 + shipping..

------------------- F L A S H L I G H T S ---------------------

4-D cell (2x2 style), krypton bulb. In box, never used.
$5 + shipping.

6-D cell multifunction lantern. Sleek tubular style with
bright incandescent light at end, 6W fluorescent bulb
along bottom, and flashing red and yellow on top. Also
has electronic sonic alarm that can be switched on with
the flashing lights. In box, never used. $12 + shipping

3-C cell Eveready worklight-style. Bright yellow with
hook for hanging, frosted bulb to diffuse light over area.
Unused, but no box. $5 + shipping

Batteries NOT included.....

COCA-COLA caps. Red cloth, white lettering. New.
$8 each + shipping. Only 9 available.

..... FOR YOUR DRIVING PLEASURE .....
1929 Mercedes SSK kitcar on VW chassis. Just completed, never titled.
Yellow, with brown fenders and running board, tan convertible top, side
curtains, and tonneau cover. Gold trim instruments.

COBRA 18-ULTRA CB ---- 40 channel, pushbutton tuning, with 3
NOAA weather channels. Includes microphone, but no mounting
hardware. $ 35.

LEXMARK/IBM PORTABLE PRINTER 5183 ---- powered by rechargable
battery or AC wall adaptor (included), this printer is only
11.5" x 3.5" x 2", and weighs about 2.5 pounds with battery
in place. Using silent thermal print head, it will print on
either thermal fax paper or on regular paper using the enclosed
thermal transfer ribbons. Very quiet in operation, and because
it runs on a battery, it is completely portable, for use with
laptop computers anywhere. Includes parallel port cable. $89.
.
ANADEX WORD-SCRIBE PRINTER ---- heavy duty dot matrix printer.
Multiple ports, but no literature so only parallel port in use
now. Tractor or friction feed. Fast, good quality; 17-inch
platten. $ 15
.
add shipping to all prices.

In article <5o1kal$hnp@news.interaccess.net>, Sean McGhie
<mcghie@interaccess.net> writes
>How far away should we expect to be able to receive the 118-136 and 225-400
>Mhz ranges when using a hand held scanner from a home in a typical large city?
>
>How much would purchasing a larger antenna extend the range, in comparison to
>the rubber antennas that come with the scanners?

In answer to your question, VHF comms are very much in the "line of
sight" range. Range varies hugely depending on terrain,high buildings,
surrounding land etc. In large cities one thing which occured to me as I
thought out this reply is that the high metal content in the newer high
rise buildings will give an amount of shielding, so preventing the rf
you want to hear from reaching your antenna (anybody know if this is a
recognised problem in skyscrapers?),metallic tinted glass should add to
this effect.There are also anomolies that occur due to atmospheric
conditions, skip etc that will produce lots of weird stuff, some good,
some drowning out what you are trying to hear.
Bearing the "line of sight" rules in mind, what you want isn't
necessarily a *larger* antenna, it's a *higher* one. Preferably outside
the building. Increasing the height of your antenna from the ground
increases it's "line of sight". That's why hams and professional users
mount their antennas way up on masts.
Good luck with your scanner.By the way, almost any antenna will be
better that the rubber duck supplied with your set....Except perhaps the
telescopics that come with some bearcats and yupi's here in the UK.
Like I say, *Get it up high*

I have found a couple of FPL frequencies in the Naples, FL area which are interesting to listen to...

451.2000 MHz is used to talk to "Sarasota Trouble", which seems to be the dispatcher and general trouble handler for this area. Sarasota is over 100 miles north of here, so this must be part of a wide area of transmitters. Anyone know how it works?

451.6750 MHz is used to talk to Golden Gate, which is a small city just outside Naples. I haven't had it long, so I don't know exactly what they use it for. Perhaps that is a station where they keep trucks, equipment, etc.

You can recognize FPL because they say "QSL" instead of "10-4". The original FPL dispatcher must have been a ham.

These were the original mobile phone freqs, and are still in use.
We have three duplex sytems in operation in this area for mobile/
rural home usage, although Cellular is catching up, but not always
reliable in this hilly area.

Careful about making blanket statements like that! Only units earlier
than the 4A4 (April 1994) date code are modifiable as you describe.
Later units are not.

I don't know about Motorola-brand radios, but the 235XLT TrunkTracker MUST have all the system frequencies (the repeater output, that is) programmed in to work properly. If you leave one out the radio will work, but when a conversation is switched to the missing freq. you won't hear it. The 235XLT also ignores the channel lock-out function when in trunking mode.

Remember, changes had to be made in the way the 235XLT operates when compared with the Motorola-brand radios to avoid infringing on Motorola's patents and copyrights. Perhaps this is one of the changes.

Steve,

Depending on the model of cell phone that you have, you can indeed
scan through the cellular channels. Back whenever it was still legal to
monitor cellular, I pt my oki900 into diagnostic mode, and there was indeed
a command to scan the cellular band. No, its not as powerful as a scanner
but was still pretty effective.

Hi Mike,

I bought the OptoScout quite awhile back, and I'll be honest it's one
of the best purchases I've made. Although it can be expensive, it's
pretty much well worth it. Now I have a model 25, which I would stray
away from. I know some of the scouts have problems with actually picking
up the frequency of its local oscillator whenever the antenna is off.

But as far as functionality goes, it's great. Ive picked up all kind
of frequencies. Just keep in mind its a NEAR field receiver, meaning you
have to be *fairly* close to the transmitter. Either close, or the signal
has to be pretty strong.

If you have any more questions, id be glad to answer them.

Keith

73 (a ham magazine) had an article on converting a BEL radar
detector into a 10GHZ (a ham band) receiver. The BELs use
and IF of around 1GHz, but as police radar is CW, the most you
can hear is the quiting when the CW signal "captures". This
assumes you are using a scanner in the FM mode. If you convert
the signal down to where you can pick it up on a SW with a
product (USB/LSB/CW) detetector, you will hear a tone. Of
course finding the signal will be a heartach. I know,
I modified a BEL, used a Pro2004 with an IF out to feed a
Kenwood R2000 (in the SSB mode) and parked up the road from a
food store with an X-band (10.5GHz) door opener. Hunted around
for about 20 minutes and "found" the signal. This is much more
sensitive than a standard radar detector (I could "hear" the
"radar" much further away than a "stock" radar detector would),
but the tuning is so narrow that I had to hunt down each new
Xband signal. In a real world situation, where you should be
driving not tuning, a police officer would have you long before
you heard him. And this means ruining your detector for its
intended usage. (a stock radar detector has a scannig VFO that
sweeps so as to scan the whole Xband in about 1/10 sec..you
defeat the sweep and replace it with a manual tunning control)
I have thought about getting a better, new detector, adding a
1GHz (1000MHz) If out jack, but I just don't feel its worth the
trouble.
Hams run beacons and 2way "stuff" on Xband. But there is next
no Xband activity (other than police and door openers) around

here and I have too many other things to waste money on.
Terry

4874. Re: Trunk Tracker question about channel assignments

General Information:

1. Moto radios are programmed with Basic System info:

Control Channels

System I.D.(s)

Connect Tone

And other Moto system info not relavent here.

When a system adds a new channel(s), the controller is told that
they are now available (this info must already be in thecontroller's
code plug), and the channel is added to the rotation.

BTW the Moto Ch.# sent over the CC is 1 number different that the
FCC Ch.#.... (Some people don't know that ZERO is the FIRST number
for computers) :-)

The radios therefore, know what all possible channels are, and do a
quick lookup of the Ch.# and jump to it.

For quick sale:

Icom R-1 All band handheld reciever.

This radio is tiny, but packs a serious rx wallop! RX range is from 25khz to 1.3Ghz. Full. No blocks, no gaps, no problems. Basically, if it's broadcast and in range, you can get it with this.

I'm including the Icom all band antenna, a 1-inch rubber duck (makes the package invisible in a pocket!) and the AC Adaptor/charger.

I know a new R-1 is around $500. I'm asking $400 for this one. Keep in mind that it's in great shape AND has no blockages (like the news ones do). If you want it, email me and I'll ship it COD tomorrow.

Thanks!

Dave

4878. Re: Range of Cordless Phone??

Depends on the antenna used on the scanner.. If it's a handheld scanner
with rubber duck I would say a block or two.
If on a "base" antenna up to a mile depending on the antenna. If you use a
"CB" antenna about 10 feet above your roof look for at least a mile
coverage of 40 MHz phones.

Message-ID: <5o9jng$fgn@HOPPER.ACM.ORG>
Source record: 194004

Jim Purdy <purdy@wcic.org> asked:
> Does any one know the frequency (probably 400-500Mhz) of
> the taxi services in Lafayette Indiana.

I don't have specific assignments for your town, but you might want
to search the standard FCC allocations for the Taxi Service:

152.270 - 152.450 Taxi (Base)
157.530 - 157.710 Taxi (mobile) / Business

452.050 - 452.500 Taxi / Industry / Transport
457.050 - 457.500 Taxi / Industry / Transport

Note that many taxi companies do not use a repeater (to stop drivers from
using the radio to chat and to keep cabs from 'jumping' calls).

>> questions?:

>CATV or MATV?

Good question! I see several _interesting_ antennas on the rooftop
(i.e. not only the regular TV antenna's but some special ones with
mesh reflectors, maybe link to main cable antenna in the city).

>If it is CATV, the city-wide television distribution network,
>forget it. It is a closed system. The bands you normally
>associate with communications are used for television channels.

Since I see SEVERAL antennas on the roof, and on the other hand we
have CATV channels, can it be a combination?
How about TV channel 69: Does it come from the airwaves or from the
cable system?
Hey, just recalled: We have both a MATV as well as a CATV system in
our building. Anyone that has subscribed to the CATV system was
disconnected form the MATV system and gets ALL his channels through
CATV.

>If it is MATV, a shared rooftop antenna on one building, then it
>may work. However, the antennas will tend to favor bands not
>generally used by a scanner.

Maybe I should connect my scanner to the MATV cable, but will
reception at 800-950MHz be worth it?

>Have fun!

Thank's!

Hello net friends,

I was (still...) wondering if anyone coming to Israel in the near
future can help me in getting a good scanner (such as AR-8000,
AR-2700, UBC-3000XLT). Scanners aren't imported here regularily and
cost almost THREE times as much when available...
Any help would be truly appreceated.
Please email directly so as to conserve newsgroup bandwidth.

best regards and shalom,
Amnon

---

bit bucket /n./

1. The universal data sink (originally, the mythical receptacle used to catch bits when they fall off the end of a register during a shift instruction). Discarded, lost, or destroyed data is said to have `gone to the bit bucket'. On Unix, often used for /dev/null. Sometimes amplified as `the Great Bit Bucket in the Sky'.

2. The place where all lost mail and news messages eventually go. The selection is performed according to Finagle's Law; important mail is much more likely to end up in the bit bucket than junk mail, which has an almost 100% probability of getting delivered. Routing to the bit bucket is automatically performed by mail-transfer agents, news systems, and the lower layers of the network.

3. The ideal location for all unwanted mail responses: "Flames about this article to the bit bucket." Such a request is guaranteed to overflow one's mailbox with flames.

4. Excuse for all mail that has not been sent. "I mailed you those figures last week; they must have landed in the bitbucket." Compare black hole.

This term is used purely in jest. It is based on the fanciful notion that bits are objects that are not destroyed but only misplaced. This appears to have been a mutation of an earlier term `bit box', about which the same legend was current; old-time hackers also report that trainees used to be told that when the CPU stored bits into memory it was actually pulling them `out of the bit box'. See also chad box.

Another variant of this legend has it that, as a consequence of the `parity preservation law', the number of 1 bits that go to the bit bucket must equal the number of 0 bits. Any imbalance results in bits filling up the bit bucket. A qualified computer technician can empty a full bit bucket as part of scheduled maintenance.

Source record: 194011

I will send these crystals free to whoever responds to me first that has a need for them. They are all 10.7's Please take them all.I know that there are still some folks out there that collect scanners and might need these for one of the older ones.

155.790
154.235
158.730
154.650
155.400
156.090
460.175
460.100

I am still looking for 150.775 (10.7) for a radio that I am resurrecting to listen to a dedicated freq. I use a BC 9000 and 3000 for serious monitoring but would like to use this dinosaur for monitoring a station while I am in the garage. Radio Shack and G&G are out of this one and everywhere I've called said that this is a special order and the price would be around 10.00 with a 3 week lead time.

Thanks,

Monty

I have a 200LX 2MB with an AC adaptor and a 14.4 fax/modem card. I use this only for it's terminal and my new laptop does that quite well. I packaged it all in a little box wth foam padding that I keep handy with all the goodies in case I needed to run out and work on a router in a rush.

I'd like $400 for the total package. Let me know if you're interested.

Dave

In '96 I went to Disney World with my Pro-43.
I was asked (very politely) to leave the scanner in a locker (their
dime), as they felt the scanner could spoil the feel of the park for
other guests. They never mentioned security at all.
I'm a nice guy, so I put it in a locker in the guest pavilion at the
entrance (they paid the locker fee, and I got the key). I didn't really
miss it. This was at EPCOT, BTW; we didn't go to the Magic Kingdom.

Actually, considerably farther, if by as far as it will transmit you
mean as far as the phone will operate.
Otherwise, the phone will transmit an infinite distance, but the scanner
won't pick it up for more than about a half-mile, and that's with a
decent antenna.

Can anyone give me information on where to find a copy of a programming manual for the REGENCY WHAMMO 10 scanner? The scanner is the type with the "metal comb device" (as described to me).

Please email either of the address shown below.

Thanks everyone in advance,

Dale

I need to know some scanner basics. I have a pro2006 scanner and a cheesy $18 antenna from RS. I just want to know what types of frequencies I should be receiving. Just police or what? It seems like all I can receive is the 800mhz band. Any ideas? Thanks

Steve

Steve,
The stock telescoping whip that comes with the radio should
allow you to hear quite a bit.
As for what you'll be receiving, that depends on the
services and agencies that exist in your area. Do yourself a
favor and pick up a copy of Police Call Plus at Radio Shack.
You'll find a listing of frequencies that are licensed in
your area. There's also a handy table towards the back that
lists the radio frequency spectrum and what services are
located in various parts of it.
Try programming in the frequencies for you area in some
of the memory channels and then scan.
To find frequencies on your own, pick a service/agency,
see what frequencies they use with the above-mentioned table,
program the lower and upper frequency limits for that frequency range
into a search bank and search away!
Good luck!

Strong signals,

Hope. Sad to say, they didn't make it.

> How easy is it to use or tune and is it controlled by a top mounted
> control or by the keypad?

Controlled by both. It's pretty easy to use as far as the
exotic imports go. It's most annoying traits are the
limitations in its firmware programming as to what it will
and won't let you do.

> Does it work very well?

I posted a review of this radio a few months back. If
interested in reading it. Have a look at my web page below.
Click on Radio Monitoring. Find my list of receivers. Click
on the R10 and you'll see the link to my review.

Happy reading!

ok I'm doing this from memory don't have papers here with me.
In one corner of main pcb is a 100uf cap this is for memory retention
when power is off. Many of these scanners were shipped with a defect
the hole that the + lead of this cap is in is not platted thru, so the
cap does not charge to hold memory. A small piece of wire inserted
thru this hole and soldered to both sides will fix this problem.
to verify that this the problem with power appiled measure the voltage
on the + lead if it does not read any voltage you have found it. If it
is platted thru it should read the power supply voltage .

Absolutely as new DX440 solid state portable. BFO, digital, memories, clock/timer, in box w/all documents, never outside the house, non smoker, with New ac adapter
$100

Pro 62, good condition, 200 ch, 800 mhz. (no cell), with AC adapter/charger, no box, little used but shows very minor handling.
$100

Will swap one or both for 2M stuff, or towards 10M mobile (no HTX100s please), or "export" CB, email replies please

4917. 900 Mhz Cordless Phones

Newsgroup: rec.radio.scanner
Date: 1997-06-18 00:00:00 UTC
From: Todd.Seabourn@pobox.com
Message-ID: <33a74c63.589874425@news.flash.net>
Source record: 194141

I am looking for the best 900 Mhz cordless telephone. I have been using the Escort 9600 for about 2 years and I need to replace it (...it has been dropped several times!) The phone has worked great and I love being able to carry the phone when I walk around the block. I was disappointed to hear the Cincinnati Microwave has filed for bankruptcy.

In any case, I would like the new phone to be small, with the greatest range available. Another feature I would like to see would be Caller ID built into the handset. A belt clip (or available carry case) would be nice. But of course, the main concern is sound quality. From the research I've done, it appears that I want a Digital (for clarity) Spread Spectrum (for range) phone.

The brands I've seen that seem to have at least some of these features are VTech, Uniden, Toshiba but I do not know anything about any of these phones.

Anyone have any experiences, good or bad, with any of these phones, or have any suggestions?

Also, one phone that has caught my attention is the Lucent (formerly AT&T) 9510. It supposedly has excellent range and clarity. The WWW page also shows an LCD display, but makes no mention of Caller ID. Does this phone support Caller ID?

Thanks for any advice,

Todd

I have two scanner forsale.

The first is a Pro-51 (29-956Hz). This scanner has 200 channels. I bought the scanner new two months ago. It has no scratches. Has never been dropped. I am asking $165.00 or OBO

The second scanner is a PRO-2036 (29-956MKz). This is a 200 channel Base Scanner. Has autosort and CTCSS, Auto Store of Feq., I am asking $150.00 for this scanner.

I have the boxes for both scanners. I am going to buy a new scanner and must sell these to make room. OK. My wife is making me sell them.

Email offers to rdford@traveller.com

Not directly what you wanted, but...

The AR2500 was a "follow on" from the AR2515. The Latter was a modified
AR2002 done by ACE Communications. The software used used in the 2515 was
then put into the AR2500 receiver and produced in Japan for AOR. AT that
time ACE were AOR distributors in the States.

Its no longer available as the AR2500 however it is/was still available from
ACE as the Trident TR-4500 - your best bet could be to contact ACE and see
if they can help you.

Hope its of help on your quest.

All the best

Maybe try phoning your local Motorola dealer, and ask him/her what they do when a new freq gets added to the trunk; do they recall all the radios for re-programming, or does the radio automatically know? Try asking as a "concerned trunking user" and not a scanning-type.

> Eric Detollenaere
> eric.detollenaere@vz.cit.alcatel.fr

Eric,
The new R10 is a much better radio than the R1 unless your
major buying consideration is size. The R10 does OK on SW
but the AR8000 and MVT-7100/9000 do much better. I posted
a review of the R10 a few months back. If interested, click
on my web page below, click on Radio Monitoring, find the
R10 in my list of radios and you should be able to take it
from there.
Good luck!

Strong signals,

I use a behind the head style 27 dB NRR headset from Racing Radios (Diversified Electronics, in GA), one of the models made by David Clark Co. It is the was $125 and worth every penny.

This is the same model worn by most Winston Cup crew chiefs. They are light, comfortable, and tough, with clear audio. The best part is that you can keep the overall volume very low, which makes for very comfortable listening over long periods, and extended battery life. This headset also features a detachable, field replacable cord.

I also use them with a walkman to listen to a rebroadcast of my scanners at home while I mow the lawn.

4947. Re: Trunk Tracker question about channel assignments

Newsgroup: rec.radio.scanner
Date: 1997-06-18 00:00:00 UTC
From: Thomas Gasta <tomgasta@worldnet.att.net>
Message-ID: <5o8ki6$544@mtinsc03.worldnet.att.net>
Source record: 194171

Motorola radios are programmed with just the 4 frequencies that would have the data channel on them in any given time (the data channel can, and most often does, change frequencies about once every 24 hours). They do not have all the other frequencies programmed into them and do not care what they are.

The control channel will tell all the radios in a given talkgroup or subfleet that their presence is requested on channel # 159 say. The FCC has channel number allocations for all 800Mhz frequencies. The radios internal software merely looks at the channel number designator on the data channel, then, self synthesizes (temporarily) the actual frequency that the radio is told to go to via the data channel. One asked a question about adding channels to a system. Here is the very good reason that Moto does it this way. A system owner can go from 5 to 10 to 20 channels over several years (and by meeting loading requirements), but as the radios do not care about talk frequencies, he would not have to reprogram the entire systems radios, as long as he keeps the original 4 frequencies as control channels.

Why didn't Uniden do this? Don't know, don't care! Unit works better than all the other Trunk Tracking scanners on the market now doesn't it. I suspect to this day that it is due to copyright problems. As some have asked, why didn't the Uniden display the actual Motorola Talkgroup codes in their Hex format. Some say LCD problem, pretty lame, others say keyboard problems without alpha characters, maybe, but again, don't really know, don't care. As a scanner, it does one thing, follows trunked radio systems. As a typical consumer of such equipment how many even know the differance between a Hex code and a decimal code. Uniden did not make this scanner for those who want to collect "secret" talkgroup codes to program into their Moto or other trunked radio,s, they made it for the hundreds of thousands of scanner geeks who don't know Moto from LTR from EDACS. Yes it would surely have been easier to be able to just program the data channels and let the radio do the rest, especially for all the consumer types, why, ask the software "designer" at Scan-L. Or Uniden, maybe the next one will work that way, if they can legally do it. Or maybe a radio that Uniden makes for about $110 doesn't quite have the same inards as say a Motorola MTS2000 portable at $2000.

F O R S A L E

MARACOM M5100 Marine Transceiver ---- 5 and 25 watt
transmit on marine frequencies. NOAA weather channels.
Digital readout. Includes microphone, no mounting
hardware. $ 60 + shipping in US.

MOTOROLA MTX9000 fm handi-talkie radio,
model H01WCF4DB5AN NX type WCMA.
900mHz range. With charger and info.
Only $499.

PCMCIA Sound Card --- by AMP. Includes software,
cables, microphone.
V-Synth wavetable synthesizer
Wave SE sound editor
Stratos MIDI software
MIDI Tune-Up
Windows Sound System software
Cardsoft Card and Socket Services
Traveler adapter module
Microphone
Compliant with PCMCIA Release 2.1
12-bit recording and playback
5 sampling rates
Turtle Beach Hurricane architecture
Thin-profile Type II card
requires:
Type II or III PCMCIA socket
386, 486, or Pentium processor
4MB of Ram
$65 + shipping..

------------------- F L A S H L I G H T S ---------------------

4-D cell (2x2 style), krypton bulb. In box, never used.
$5 + shipping.

6-D cell multifunction lantern. Sleek tubular style with
bright incandescent light at end, 6W fluorescent bulb
along bottom, and flashing red and yellow on top. Also
has electronic sonic alarm that can be switched on with
the flashing lights. In box, never used. $12 + shipping

3-C cell Eveready worklight-style. Bright yellow with
hook for hanging, frosted bulb to diffuse light over area.

Unused, but no box. $5 + shipping

Batteries NOT included.....

COCA-COLA caps. Red cloth, white lettering. New.
$8 each + shipping. Only 9 available.

.... FOR YOUR DRIVING PLEASURE ....
1929 Mercedes SSK kitcar on VW chassis. Just completed, never titled.
Yellow, with brown fenders and running board, tan convertible top, side
curtains, and tonneau cover. Gold trim instruments.

COBRA 18-ULTRA CB ---- 40 channel, pushbutton tuning, with 3
NOAA weather channels. Includes microphone, but no mounting
hardware. $ 35.

LEXMARK/IBM PORTABLE PRINTER 5183 ---- powered by rechargable
battery or AC wall adaptor (included), this printer is only
11.5" x 3.5" x 2", and weighs about 2.5 pounds with battery
in place. Using silent thermal print head, it will print on
either thermal fax paper or on regular paper using the enclosed
thermal transfer ribbons. Very quiet in operation, and because
it runs on a battery, it is completely portable, for use with
laptop computers anywhere. Includes parallel port cable. $89.
.
ANADEX WORD-SCRIBE PRINTER ---- heavy duty dot matrix printer.
Multiple ports, but no literature so only parallel port in use
now. Tractor or friction feed. Fast, good quality; 17-inch
platten. $ 15
.
add shipping to all prices, only in US....

I saw a scanner at a pawn shop the other day - a BCT-3. It had the same basic shape as a BC-350A. It was preprogrammed, and it had the highway alert. It had a switchable green backlight and hard plastic buttons, unlike the usual soft rubber Bearcat buttons.

I've looked all over the place - nothing in catalogs, or on Uniden's web page.

Have you heard of it? If so, how much is it new? Is it a good scanner?

Please mail me directly because I can't get newsgroups half the time on AOL.

Hi there! I have a Realisitic PRO-42 (Radio Shack) handheld scanner for sale. I'm asking $50 for this baby (I paid $80 for it on clearance 2.5 years ago). It's in mint condition. I may have used it 10-15 times. It's just collecting dust, and I need the cash to buy an HT-202. It has a few minor scratches in the front (you can hardly notice them). Just beeing honest. I used to place it "face-down" on the shelf. Other than that it is perfect!!! I bought this with the intent to use it with a RAMSEY Cellular kit. Their kit costs about $50, and it lets you listen in on cellular conversations. For more information take a look at http://www.ramseyelectronics.com/prod05.htm

Specifications: I don't have the box, or instructions, but it is SIMPLE to use! It is 10-channel programmable. It has a phone-type keypad, which allows you to "plug in" the frequency you want. It has a FULL frequency LCD display, and built-in light. Frequency coverage: 30MHz-54Mhz, 138Mhz-174Mhz, and 380MHz-512MHz. Again, you
may add a kit like the RAMSEY-KIT and be able to receive cellular.

Sorry if this is a long message, but some people might be interested in this info. I estimate that S&H costs will be an additional $7.50, but I'm not sure. I live in Philadelphia, PA. Thanks for your interst!

George

Question, what are you near while scaning? A computer? a TV? or just
outside?
Computers and TV give off lots of interference! Also if you have cable TV
you could be picking up leakage from the cable.
Also it could be internal "Bridies" that your picking up. A good way to
tell if it's internal to the scanner is remove the antenna and search
30-512, where it stops in a "Birdie" in the manual is a list of common
birdies that RS knowws about when they produced the scanner.
I just ran 144-146 and the scanner stops at 144, walking 5 feet away from
the computer resumed the search!
When you touch the antenna, you shield the antenna from the niose source.

Check to make sure your receiver's front end is not out of alignment.
Try programming frequecies both 5 kHz lower and 5 kHz higher
than the assigned frequency and listen in NFM mode, e.g.

162.545
162.550
162.555 MHz

That was the problem! The signals are coming through 5 kHz lower
than the actual frequency. Now, any ideas on how I can fix it?

Thank you Bob!

No. Radios monitor the control channel and a system could change
channels add new ones or turn problem ones off daily if they wanted.
The control channel tells the radio what frequency to jump to. Its
called the channel assignment.

> Try
> asking as a "concerned trunking user" and not a scanning-type.

>: 3) 1&2 mean simplex?

A very common practice is to configure the F1 channel pair for the repeater system and to configure F2 as a simplex (aka repeater talkaround) channel on the same frequency as the repeater output on F1. That way for short range car to car work the units can still hear the base dispatcher but can talk freely unit to unit amongst themselves without tying up the channel with chit chat or tac traffic. I have seen this done with both VHF and UHF systems and radios. Happy Scanning.

>anothers computer and learn what was being processed.

Dont know the frequencies used, but they worked off of RF emitted by the display screen to read what was being displayed. Other RF hot points inside the computer could also probably be utilized to pickup data streams, at much higher speeds. I know every hard drive I've seen makes some noise somewhere on low band (25-50 Mhz). Theres a great deal of theoretical info available, but little gear for sale to the public. Better shielding in both case design and video terminal design have greatly lessened the range at which this could be done.

Having spent too many years at boogie joints with my ears next to the speakers, and driving loud cars, and in the stands at races, I have finally learned that we do severe damage to our ears with loud noise. I think the answer is to try to eliminate the noise of the track, so you don't have to obliterate the sounds with even louder scanner rattle. That's the hard part, because I like the roar. At Indy in the turbo days, in the main straight, with walkman type ear phones I had to have the radio commentary up full blast, and still couldn't hear it. So I spent the bread and got a set of those big red earphones from Racing Electronics for the scanner. Easier on the ears.

This may sound silly, but it works for those of us in
aviation. Put a pair of those throwaway ear plugs in
your ear, then place the headphones (possibly with a
good gel ear cell) on. You'll find that much of the
loud and bothersome noises are blanked out and the
voice chatter is perfectly audible.
Good Luck, and let us know if you agree!
Al

4974. For Sale: ICOM 735 for only $575.00

Newsgroup: rec.radio.scanner
Date: 1997-06-19 00:00:00 UTC
From: t95194@aol.com
Message-ID: <19970619210600.RAA08612@ladder01.news.aol.com>
Source record: 193948

I have for sale an Icom 735 for $575.00 firm. I will cover the shipping to you.
It is in good working condition and has the box & manual. I purchased the radio in 1992, and I am the second owner, so I am not exactly sure on the age,but believe it is 8 to 9 years old. It is just the standard radio, no added extras like filters. I am willing to meet up with someone on the air if they would like to hear the radio.

For more info you can e-mail me at:

t95194@aol.com

Please send inquires to my e-mail address instead of posting them here, since I am not sure when I will return again.

73's & Thanks

Dave (N9NMD)

> tracker

Ron,

Motorola radios only require the control channels it's true. But, see if you can find someone to show you all the information required to program a Motorola trunked radio. You will see that there are several different frequency "plans" in use. By frequency plans, I mean that a given series of channel designators in the Outbound Signal Word (OSW), refer to different frequencies in the different plans. For example, channel 001 might designate 851.xxxx in one plan and 851.yyyy in another. When you program a Motorola radio you have to tell it which plan is being used. After you've done that, the radio now "knows" how to interpret a given value in the channel field of the OSW. Uniden could have done this too. But it would have required that the user know what plan was in use. To do that he would need to know which frequencies were in use on a particular system. He would then have to determine which plan those frequencies represent. The user might as well just enter all the frequencies and let the radio worry about it.

Concerning tracker.exe: this program does not properly decode all the channels in use by Motorola systems.(This limitation is mentioned by its creator) It uses an incomplete channel<-->frequency mapping algorithim.

> Anyway so I'll ask again, why does the radio then not just tune into
> the control channel then tune in a channel assignment and jump back
> when finished?

The BC-235 does work like that. It's just that the step of converting a channel assignment to a frequency, uses a different algorithim, for reasons stated above.

> Again no frequency plan is needed in any case. All the needed
> frequency information is contained in the control channel. Uniden
> is already using this information.

Not to belabor the point, but, ALL the frequency information is NOT contained in the control channel data. You need the information I've outlined relating to the frequency plan in use. For instance, are you

familiar with splinter frequencies?

> Just seems like a very stupid way of doing things.

Sorry, I did my best to make a user friendly radio. I know it would be better if no knowledge beyond the data channels was needed. But that's not the way it is.

Greg Knox

#-> rychard@atl.mindspring.com

For those arriving from out of town and need the 'short'
version of what's available here in metro Atlanta
in terms of repeaters, I submit the following list for your
benefit and unlimited use!

I use this list personally and update it at least once a week.
For those who are visiting Atlanta, this is the exact same
list that I E-Mail to them.

So I trust you that are planning a trip to Atlanta for this
fest, take this list (printed) with you. I promise you'll have
no lack of fellow hams to talk to - virtually 24 hours a day
while you're here.

If anyone's interested, I normally hang out on the Douglaville
SCARS repeaters. Mainly 145.110 and 444.575 and in the
220MHz Im always on 224.700.

73's and hope everyone enjoys their stay here in Hot-Lanta!!

Well, it's not like they're going to publish such information
themselves.
So, I don't think you'll find the "official" list.

I found one at http://www.access.digex.net/~bote/syst2d38.html

It has the public safety talkgroups, but the rest is pretty sketchy.
Who listens to the dog catcher anyway??

Grove sells a headphone set for under $25 that has individual volume
controls and a mono-stereo switch inline. I use it when our loca Ham
Club does communications for the local Red Cross at University
football games where the noise can be horrendous! They work great!

Bob, Try http://www.trunktracker.com

Part of the fun of scanning is trying to figure out what's going on. We started out first to determine which frequencies to listen to. Then came the analysis of user ID's. When we figured that out we started to analyze the PL codes. With the TrunkTracker a new area has opened up to figuring out who belongs to what group and the analysis of missing groups. Do some listening and analysis yourself and share it with the group instead of just asking for answers.

regards

Ed

> quick lookup of the Ch.# and jump to it.
>

Sorry the radios do not know what channels to go to unless told by the
controllor.

It is the FCC channel assignments that the controllor spits out and the
radio converts to a frequency. Some by a list programmed in the radio
software and some by doing some math.

Contact the Frequency Fan Club at 1-800-RACE FAN. They have VERY good
headsets that work well with most scanners. Most are manufactured by,
Peltor, a well-known manufacturer of sound attenuators. I am a race
course worker and have used one of their sets for several years. They
are a bit on the expensive side, $75.00 and up, but well worth it. They
are the only units that are light weight enough to wear comfortably all
day, and are rated at 27db noise reduction. Contact me at
deager@erols.com for additional info.

Don.

WRONG. WRONG. WRONG. I say again...WRONG. The noise that you hear is in actuality the sub-harmonic of radioactive sperm (169.47875) as they seek to communicate with receptive ovums floating in cosmic ignorance.

Please note that I have compiled C-source and am working on developing decoding software to use with my R7000. Perhaps Uniden is also attempting to beat me to the punch.

JobasF wrote:
>
> What does the term duty cycle mean
> in relation to power supplies and transmitters

For transmitters it is the deals with the percentage of time that trasnitter can deliver a specified power level. Most of time the duty cycle you would be concerned with is for the final power amplifier of a trasnmitter.

A 100%, or "continuous" duty amp can run a its rated power non-stop. This is generally the type of amplifiers we use in repeaters.

Percentages less than 100% are just for guessing purpose as far as I am concerned. They normally have more information than just a single number. "50% duty cycle" doesn't tell you much. Does that mean it can go 1 hour continuously as long it gets an hour to cool off? One minute on and one minute off?

Power supplies are the same way. "12 Volts, 50 Amps Continuous Duty" as opposed to something like "12 Volts, 50 Amps Intermintant Duty, 30 Amps Continuous". What does intermitant mean? Usually it tells you in the documentation or more detailed specs somewhere.

Regards

The PRO-60 is an excellent mil-air scanner. I have one and that is 90% of what I use it for. With the rubber duck I can hear the fighters working in the Brownwood MOA, 80 miles away. The scan speed is good, and 200 memories is plenty.
AM,FM WFM is selected by the keypad. AM is used for aircraft, FM is used for public service, hams etc, the wfm is used for tv audio and fm broadcasts. It is a great scanner!

5016. **WHAT'S ON 159.075 MHz AROUND PHILADELPHIA?*****

Newsgroup: rec.radio.scanner
Date: 1997-06-19 00:00:00 UTC
From: eugened@aol.com
Message-ID: <19970619010301.VAA11034@ladder02.news.aol.com>
Source record: 194040

Hi,

I have found the 159.075 MHz frequency on my scanner. It seems to be a

state wide or double state wide repeater system (PA and NJ.) I hear calls like "KP station from KP-12" KP stands for King of Prussia. I also hear Harrisburg alot and I once heard Mount Holly, NJ. The calls seem to be very irregular. Some times I hear calls to phone booth boxes on the PA turnpike, while at other times I hear a call to a broke down motorist on the road. The system uses a repeater. I also hear police and licence backround checks. My location is Lower Bucks County, PA, it's just north of Northeast Philadelphia. I usually get a decent signal on my 1981 Bearcat 100XL scanner, but at other times it drops out alot. If anyone has any ideas, please e-mail me.

Thanks, 73's,
EugeneD@aol.com

5023. Trunk Tracker Code Chart

Newsgroup: rec.radio.scanner
Date: 1997-06-19 00:00:00 UTC
From: mm505@mindspring.com
Message-ID: <5oa4q7$hg6@camel12.mindspring.com>
Source record: 194047

Down south in Atlanta, all the Metro area counties use the Motherola trunking. They are made up of various Type I, II & IIi. In Cobb County just to the north, they are on a Type II system. All of their codes are in multiples of 32 FROM A BASE OF 16. I simply made out a spread sheet in Excel with the 1st number of 16 and in the next cell I used the formula of =A1+32 and then clicked and dragged up and down and made out a pretty good sheet. I have not seen any of their codes go over 10000, so on 2 pages I've got a great way of tracking their codes. Of coursed, your coverage may vary, but this works out great here!

-Karl..

I read your message the other day, and figured, Oh, what the hey, whats $30 or so at Rat shack. Well, much to my suprise, it works!! It has easily doubled the number of, ah, 800 Mhz 'stations' that I can receive. I've got a Pro-26 with the Attenuate button, ah, modified for another use, so I was worried about too high signal strength. I've tested this setup extensively, and have found no downside. Thanks for the great tip. I'm sure purists will say that an outdoor antenna would be even better, but I'm extremely happy with what this has done for the things I like to listen to:

Airport 4 miles away - I can hear planes twice as far out.

Police was always good, but now I can hear Highway Patrol I could never hear before.

The, ah, 800 Mhz 'stations' I mentioned before.

I paid $37 for a Diamond whip that didn't improve any of these much at all. The $30 or so I spent on the RS setup is a huge improvement... Thanks for the tip...

> I was wondering what other people use at the track?
>

The DC Region of SCCA, where I am assistant flag chief
uses truly wonderful TELEX headsets
for pit workers, corner workers, starters, etc. These cost several
hundred dollars each, which is more than I wanted to pay for
my own use when not on the track radios. I checked out a
variety of headsets, then decided to do it myself.

The solution was a set of shooter's earmuffs, slightly modified.
These muffs have a foam cushion which can be pried out without
damaging it. Behind the cushions I mounted a set of small speakers
salvaged from a cheap pair of old stereo headphones. These are
about 2.5" in diameter. A touch of solder and a little wire to connect
them, one small phone jack, and I had the cheapest set of truly quiet
headsets I have yet found. They nearly match the Telex's for noise
reduction, and the sound quality is great.

5028. Re: TK-320 help!

Newsgroup: rec.radio.scanner
Date: 1997-06-19 00:00:00 UTC
From: wb36atl@aol.com
Message-ID: <19970619033401.XAA20685@ladder02.news.aol.com>
Source record: 194052

the TK-320 will always be 450-470MHz, the CPU is hardcoded to do so.
Even if you got the CPU to allow the entry of something above or below the
range, the VCO would not lock. Get a TK-340, it will do 430-470MHz, has
better RX/TX audio, some have DPL, and is a better design.

Good luck,

Erik Bagby

On 18 Jun 1997 22:54:32 GMT,
in the newsgroup rec.radio.scanner,
firecomm@aol.com (FIRECOMM)
from AOL http://www.aol.com thoughtfully posted:

> Hi
>
> Does anybody know how to reset this scanner. When I turn this scanner on,
> it reads FRR ERR. It won't program anything.

The batteries are probably low (is the "BATT" indicator on?)

I usually get that error when the batteries are low. As the batteries die,
the audio starts to have a "ring" to it, then the UHF channels error out,
then it finally dies with a whimper.

The radio runs off the battery at all times. Even if you plug in the
charger, the radio will not come to life until the batteries are charged up
to a certain point. If you have a couple dead/shorted cells, the batteries
will not reach the proper point.

This sounds stupid, but it has tripped me up more than twice: Check and
make sure the keyboard lockout switch is not on. It is located on the left
side in the "push-to-light" switch. If it is in the up (locked) position,
only the silver "scan" button on the top works. This switch can be easily
"bumped" while inserting/removing the radio from the carrying case.

This is risky, so do it at your own risk: Try removing the batteries and
running it off the charger. This will produce a loud "hum" in the audio,
but you should be able to program it. If you can, then the radio is fine
and the batteries are bad. If not, then there are bigger problems.

So check your "lock" switch to make sure it is in the "down" position, and
check the condition of your batteries.

If you do find out what the "all clear" command is, please forward/post it
for us.

Cheers,
Paul Grohe

I means that you have changed the mode from its normal preset
position.(mode means AM - FM - WFM) To get it to stop flashing and reset
to its normal mode just press the reset button (bottom bottom in same col.
as mode button).

Is there anybody out there with an opinion of either the Diamond D707
active antenna, or the Austin Ferret antenna? I'm considering purchasing
one of the two, and would appreciate any comments on them, in regard to
any problems, and how a comparision to something like the Diamond Discone.

Email replies preferred..

Thanks..

The list of CB Shops is finally available for your shopping & repair needs
all over the nation.
CB Shops listed from East to West and North to South are available
and
ready to address your needs. Some carry hard to find equipment, and

some carry wholesale parts & equipment.
Whether it's a brand new radio or an old tube type amplifier, your
chances
of finding what you need are much greater and faster with this
brochure.

This brochure is LOADED WITH OVER 50 names, addresses,
and telephone # 's of
different shops, shacks, and even, shops on wheels.

This brochure will pay for itself with the time it will save you
in searching
for that one shop that can accommodate your specific needs.

Here's how to get your copy of this, fast selling ,
brochure.....

Send $2.00 cash, .32cent stamp , and of course, your snail mail
address
to.....
(please include your e-mail address)
TEAMWIN 01
P.O. Box 0583
Loveland, CO. 80539-0583

I am looking to start up a contacts lists of Canadian scanner monitors in an attempt to create a database of information so that scanner frequencies from across Canada can be found quicker and easier (by simply finding a contact person) instead of asking thousands of people that aren't even sure what area you are talking about.

I understand that it may sound a tad dumb but I still believe it is an idea.

Thanks,
Jeff Richard

ONLY AVAILABLE IN THE:
U.S.A, CANADA VIRGIN ISLANDS, AND PUERTO RICO

BE SURE TO GO TO OUR SITE AND CHECK OUT OUR FREE TRIAL.

Call everyone and tell them to throw away all of your old home, office, fax, pager, voice-mail, and cellular numbers and give them your New "Virtual Office" 800/888 number! The only number any one will ever need.

Are you tired of giving out all of your different phone numbers to everyone? Wouldn't it be nice to be able to give everyone just ONE phone number that will find you anywhere you are? Even out of town, or in a restaurant, or even on the golf course.

Now you can.

We have the answer to all your communication needs. It's called the "Virtual Office".

And this new service is loaded. It comes with features like:

An automated Call Attendant, Live Call Connect (in real time), Fax Sending, Fax Receiving, Even without a fax machine! E-Mail Notification and Delivery, Without a PC!, Outbound calling, Low Cost Long Distance Service, Inbound/Outbound 800/888 Number, Worldwide Call Transfer, Call Forwarding, Call Screening, Full Service Voice Mail, Nation Wide Pager Notification, Conference Calling, Speed Dialing, Auto Dial, Auto Messaging, Temporary Greeting, Unavailable Greeting, Password Protection, Pager Notification, and No Equipment or Software to buy, "Ever".

Priced from $9.95* per month, Plus 10.9 cents per minute per event.

That's less than one phone line would cost per month.

For more information please visit our web sight:
http://www.mynumber.com

* Based on our best priced plan.

Source record: 194065

The 2006 has pre-set modes for various frequencies. If you change the mode from the preset, the new mode indicator flashes to let you know that you have selected a "non-standard" mode for the range you are in. If you have returned to the preset mode from a different mode, the indicator will still be flashing; press "RESET" on the front panel to stop the flashing.

> Let me guess. As far as the cordless phone will transmit?
Now wait fellows, look at the original post from Jose.
The KEY is in the term CORDLESS that's the part you hold in your hand.
The BASE unit is not CORDLESS. The hand unit has one range on one set
of freqs and the BASE has another range on another set of freqs.
Ok now let us say that radio waves go forever no mater what the power
level is of the transmitter (which we know is prob not true). The
answere would depend on the receiving capabilities of the SCANNER.
I have an old, old Reagency scanner with a very week front end and I
have a Rat Shack 2006 with a preamp and good antenna. The 2006 will hear
the transmitter at a greater range than the old scanner with no antenna
and a poor front end. Does this sound like I'm crazy sure it does.
The question posed by Jose is = to haw far can you hear a fly sneeze.

> The $30 or so I spent on the RS setup is a huge improvement... Thanks for
> the tip...

Just wanted to throw out a word of caution to others who may be
thinking of trying the RS amplified antenna. These cheaper designed
amps will not hold up well in areas rich with strong TV, FM, pager
and cellular signals. Chances are high that you will receive much
more intermod than without it.
Since most Radio Shacks offer a 30-day money-back, be sure to
check out this device thoroughly in all locales where you plan to
use it. If it seems to do help more than hurt, good for you. If
not, simply return it.
And I will assume that the Diamond whip mentioned above is the
RH-77CA? A review I did of 27 handheld antennas found this one to
finish 6th overall. If excels in the 80-108 and 145-205 bands and
is above average in 30-80, 118-137, 400-512, 850-870 and 870-890.
It proved to be average in 925-960.

Strong signals,

Hello -

Can the Radio Shack -2004 scanner be controlled
by a computer as can other models?

Have you done it, or have any experience with
'2004's that have been modified for computer
control?

What hardware is required?

Any commercially available boards/mod kits
that you'd either recommend, or suggest that I
should stay away from?

What software is available for the venerable PeeCee
can be used/ is good/ is rotten?

Any reference material you'd recommend?

Thanks for your time.

This is definitely a strange chart. The cellular band is generally
broken into 2 pieces, one being the non-wireline carrier, and the second
being the wireline carrier. The wireline carrier is you local phone
company, while the non-wireline carrier is a cellular-only provider in
you area. Each of these two can be broken into 2 other parts, the
remotes (i.e. handhelds or mobiles) and the bases (repeaters). I find
that the repeaters are more interesing because of the duplex
conversations, i.e. usually present are both the caller and the callee.
There is a better description of this bandplan in a file that has been
posted on these newsgroups called "scanner.faf".

5061. ICOM R10 with bandpass filters?

Newsgroup: rec.radio.scanner
Date: 1997-06-19 00:00:00 UTC
From: sba3020@InfoNET.st-johns.nf.ca
Message-ID: <5obmptqef1@coranto.ucs.mun.ca>
Source record: 194085

Can someone tell me if the Icom IC-R10 reciever has (as the product brochure says) a "Newly-designed, tunable bandpass filters provide good image and intermodulation rejection"

Do this receive have this?

How easy is it to use or tune and is it controlled by a top mounted control or by the keypad?

Does it work very well?

5062. Trunktracker Fleet Maps Site

>I once seen an article that said that all computers put out an
>inadvertent radio signal and that anyone could listen/or tap
>anothers computer and learn what was being processed. Any truth
>to this? Is there any special frequency or does every model of
>computer have its own.
There is some truth in this, but only the part where you stated "all
computers put out an inadvertent radio signal" They certainly do that
all right, but it's just interference, no discernible signal and it is
very broadband and very loud at HF frequencies, often enough to wipe out
anybody trying to listen to HF anywhere near the computer.
Newer computers are better screened, but still not great.And computers
from different countries put out differing amounts of RFI as they are
built (and screened) to each country's legal requirements.

I'd guess that upon finding this AB7GR after his purchase of the gear fraudulently, the gear was tracked to his buyer (our poster), and he had to return it to Ten-Tec, the victim.

jobasf@aol.com (JobasF) wrote:

>What does the term duty cycle mean
>in relation to power supplies and transmitters

Hello Gene,

Duty cycle for transmitters/transceivers refers to the ratios of:
1) Standby (squelched receive) time
2) Receiving time
3) Transmitting time

Usually given as 80/10/10 or 90/5/5, referring to the percentages of each, in the above 1) 2) 3) order. 80/10/10 means the radio is listening to a dead (squelched) channel 80% of the time, an active channel with receiver producing audio 10% of the time, and transmitting 10% of the time.

Batteries usually are rated for an 8 hour work shift at one of the above duty cycles. 80/10/10 is most realistic. Motorola arbitrarily changed the standard to a less stringent 90/5/5 on their high powered portable radios so they didn't need enormous batteries to claim an 8 hour shift duty cycle.

If you're in an area with a lot of radio traffic, these ratios will be different, and you may need to swap batteries to make it through a shift. If you're working a quiet shift with the radio silent most of the time, they'll go the other way and your battery will last longer before needing to be charged.

Many small portable transceivers will rate their batteries at 90/5/5 to claim 8 hours usage with tiny batteries. Larger, older and/or non-Motorola radios may still use the more honest 80/10/10 spec.

On our website there are articles discussing batteries and this topic in more detail. Go to the ARTICLES section, and read the ones called, "Zen and the Art of Battery Maintenance." Other communications and surveillance articles there also. Comments invited.

Hope this helps ..... Steve

Another thought on the 2005/2006, there is a switch on the back near the antenna BNC connector labeled ATT, 0db, 10db In the 0db position the scanner is most sensitive! The 10db position attenuates the signals you receive.
With the "stock" antenna the 2005/2006 works well, you do have it screwed in and pulled up all the way? I can receive 800 MHz without the antenna for the local stations. try the weather channels 162.400, 162.475, 162.550, one of those should come in in most places. Also follow Rich Ws suggestion, get a copy of PC!
Also don't expect too much on 30-50 MHz, most police are moving to 400 or 800 MHz!

HElp !!!!!

I am looking to scan cellular phone frequencies but don't know anything about it. I have a cheap little portable scanner 50 XLT i think and I will obviously need to replace it.
What is the best "bang for the buck" portable scanner that I should consider. What about those adapter units that make "any scanner recieve cellular"? are they junk?
I would like to spend only a few hundred dollars on the total package but I really would like something of respectable performance. Static, noise, intermod, etc. are not want I want to buy. Is this possible on my budget for new equipment?
Radio Shack PRO-60 on sale for $199. Good idea or total waste of time?
What frequencies are cell phones on and how many possible channels are there? What happens if one phone is operating on a channel and another phone tries to use that channel? Does phone two just go to another frequency?
If someone could shed some light on all this I would be VERY appreciative. I want to buy something and be running in a weeks time but I really need some help. Email or Post

Thanks Everyone,
Jim

>program that was posted to this newsgroup before. It was called trunk
>tracker

Motorola radios only require the control channels it's true. But, see if you can find someone to show you all the information required to program a Motorola trunked radio. You will see that there are several different frequency "plans" in use. By frequency plans, I mean that a given series of channel designators in the Outbound Signal Word (OSW), refer to different frequencies in the different plans. For example, channel 001 might designate 851.xxxx in one plan and 851.yyyy in another. When you program a Motorola radio you have to tell it which plan is being used. After you've done that, the radio now "knows" how to interpret a given value in the channel field of the OSW. Uniden could have done this too. But it would have required that the user know what plan was in use. To do that he would need to know which frequencies were in use on a particular system. He would then have to determine which plan those frequencies represent. The user might as well just enter all the frequencies and let the radio worry about it.

Concerning tracker.exe: this program does not properly decode all the channels in use by Motorola systems.(This is mentioned by its creator) It uses an incomplete channel<-->frequency mapping algorithim.

>Anyway so I'll ask again, why does the radio then not just tune into
>the control channel then tune in a channel assignment and jump back
>when finished?

The BC-235 does work like that. It's just that the step of converting a channel assignment to a frequency, uses a different algorithim, for reasons stated above.

>Again no frequency plan is needed in any case. All the needed
>frequency information is contained in the control channel. Uniden
>is already using this information.

Not to belabor the point, but, ALL the frequency information is NOT contained in the control channel data. You need the information I've outlined relating to the frequency plan in use. For instance, are you familiar with splinter frequencies?

>Just seems like a very stupid way of doing things.

Sorry, I did my best to make a user friendly radio. I know it would be better if no knowledge beyond the data channels was needed. But that's not the way it is.

a Pile of Uniden pro 500's and 510's -$25 each + shipping (no mics).
Cobra 148gtl like new crystal kit for 26.515-27.865 MODIFIED
26.305-28.305 Mhz 10Khz jump/drop, rebiased audio section (for clean and
loud sound)
$175 obo +shipping

RCI-2950 26Mhz-32Mhz plus any other conversions you want....upon request
includes turner mic excellent condition. $200+shipping

Sadelta Echo Master + Classic
dual metered currently wired to 2950 to be powered from internal regulator
will wire for any radio, mike is practically untouched.
$75 + shipping

CONNEX 3300 AM/FM w/adjustable Echo, *5tone adjustable roger beep,
26.305Mhz-*28.605Mhz
New in box last week until I removed it for mods
Mods include, *Upgraded power supply, *ECG outputs, matched pair
*10Khz jump, *extra high channels, *widebanded output for consistant
output
across all channels (VERY stable) Output exceeds *10W dead key with
forward
RMS swing on the CB servicemaster (dynascan) Radio is in *NEW* condition
and has
been keyed under a dozen times for output checks as well as an on air
check
(some trucker decided I owed him a new speaker after I shook it in it's
cabinet)
The radio comes w/ all accessories to mount it in your car,truck or rig

Heavy duty uniden style power connector (ask about *fool proof polarity protection!)
All Manuals, Box and packing materials as well as stock and *Turner Mic.
Radio was all ready for customer and he never came for it, his loss is your gain
Radio includes a spec sheet containing information on all modifications, how to
access them as well as undo them (Why?) We took a decent radio and turned it into
a true (PERFORMING RIG) no more wondering if you sound good.
$250+shipping

(all above radios include microphone and power cord
all are tuned up and tested on my bench before leaving).

Transistorized 250W Base Linear amplifier for 11-10 Meters $200+shipping.

Transistorized 100W Mobile Linear amplifier for 10-11 Meters $80+shipping.

SCANNER Equiptment

Any Uniden scanner you want with lockout removed, e-mail model# These are shipped from
Europe to your door, so they make take a little while.These are all factory new
and prices reflect shipping charges from Europe.

Imagine being able to scan from 50Khz-1.2 Ghz with no lockouts, saving all your favorite frequencys and new ones you find in a flash! All from your computer!
WINradio for sale (government edition) unlimited memorys and scanning functions,
interactive win 3.x and win 95 displays, absolutely the most fun avaliable in
scanning technology (ISA) card ,software and manuals $650+shipping (it's light!)

COMPUTERS/LAPTOPS

IBM Thnikpad 755cx.
Pentium 75.
8M ram.
810 Hard drive.
2x CD-ROM.
Networking card(token ring).
Active matrix display.
16bit sound.
Infrared port front+rear.
any software you want win95/3.11 OS/2 PCDOS7 etc.
win95 currently installed with microsoft + ,Office professional,MS works.
$1200 w/modem/ethernet and token ring network card + shipping.

$1100 w/o modem w/token ring network card + shipping.

Ethernet Combo cards 10-BASE-2 great for in home intranets
ISA $25 +shipping

SIMMS SIMMS SIMMS

64M 72 pin (2-32Meg SIMMS) 9 chip true parity RAM new in packages
Best offer (before RAM prices come back up)

30 pin 1M and 2M modules avaliable make offer on any amount you need

486sx 25's $12
486 DX/33's $25
VESA local bus 486 board w/VESA local bus controller and Local bus video
$65

all + shipping

Various other 486 Mother boards and CPU's just tell me
what you need.

HP scanner SCSI B&W full page flatbed scanner
$100

old Apple //e w/128k and 5.25/unidrive/image writer II printer
$100 +shipping for all (it's a heartbreaker to lose this part of my past)

VIDEO GAME SYSTEMS

Nintendo 64 new and used

Playstation's new and used

Sega saturns New and used

Sega genesis (mainly used ones)

many accesories

e-mail to inquire on prices or simply make an
offer on what you want.

CAMERAS

Olympus handheld 35mm cameras....new in boxes
half off retail prices...pay what the distributors pay!
model numbers coming soon, or inquire about the model you
want.

AUTOMOTIVE TEST EQUIPTMENT

Matco's INSIGHT MPDA50 486 based engine analyzer.
MAP/MAF sensor real time testing recording and printing.
O2 sensor real time testing recording and printing.
TPS sensor " "
Printer interface included , updated software HARD case and ALL manuals
as well as extra O2 sensor probe.
Ready for exhaust gas analyzer module, leather cover case.

This unit was used as a handheld four trace oscilliscope
for car audio reasons and has minimal time on it, fresh Nicads and
charger.

measures RMS, Average, Peak ,Minimum and Maximum voltages simultaneously!
Measures any one of the above while giving a waveform output on screen.

Measures 4 simultaneous inputs in 4 trace LAB SCOPE mode.

all software driven for easy upgrades(this unit will not go out of date).

All data is stored on a PCMCIA flash ROM card and can be printed using
included
printer interface.

If you've never seen the unit ask your local MATCO tool rep.
This unit does everything a handheld Fluke Scope can do and more.

1 year old,all reciepts including updates,printer upgrade and etc.
probes.

Paid $2499.
asking $1750 + shipping (gotta pay off the tool man).

CELL PHONE ACCESSORIES

Motorola digital VSP 3 Watt kit
this is the 3 Watt kit for most motorola flip phones
pc550,Micro-TAC series.
fast intelli-charger built in to base.
$150 shipped.

Motorola Micro-TAC lite.
w/ nickel metal hydride battery.
fast charger,box and instructions.
$125 shipped.
$250 to package it with the 3 watt kit.

CAR AUDIO

RockFord Fosgate Punch 4.6x.
4x30watts RMS 2 ohm stable with internal crossover.
Absolutely NEW still in shrink wrap and original box
Just don't need it anymore since my Xtant came in early
from the polish shop.

$200+shipping obo.(currently have an offer)

Sony CDX-510 In Dash CD player
w/CD controls
w/joystick remote
$210 +shipping

Sony MDX-C150 In dash Mini-disc player.
w/CD controls.
w/joystick remote.
all boxes and manuals.
$250+shipping

MISC.AND HOME AUDIO

Kenwood CD walkman.
w/ wireless remote control.
ac adaptor/battery charger
and AI DSP processing.
$75+shipping.

Night Vision Scope.
10x magnification.
infrared illuminator option installed.
w/Case and box.
$225 shipped.

Also gas powered R/C airplanes/helis (including RC rebel), Cars and
motorcycles(electric).

all items I will consider negotiating price and or shipping arrangements.I
will also be willing to barter on any items.

Items I am looking to barter for:

Ham/CB equiptment in good condition (particularly a Legal limit tube amp),

or not working in good physical shape.
Car audio Quality Amplifiers, headunits working or not working.
Computer equiptment 486DX/4's or better, RAM, Hard drives,CD-ROM's Sound
cards
Modems etc.Laptops 486 or better.
Guns, gun accessories for Smith and Wesson Sigma, Kimel AP-9,SKS,Mossberg
shotguns ,
Laser sights, Night vision scopes.
Test equiptment of all kinds electronic,auto,spectrum analyzers,scopes
frequency counters etc.

If E-mailing PLEASE QUOTE only the ITEMS you are interested in!

I just have too many toys! But I want more!
Bob
MECP Master Installer #26

go to radio shack look for a pro 2026 mobile or may be used as a base
with 12volt adapter ok look on the back the date code must be like
11a3 the 3 is the year 1993 get it!!! has to a code before 4a4 then
most likely it will be the old one on the shelf that they can't get
rid of but that is the one you want they are on closeout for 99.00
pretty cheap.. too. after you get it the mod for it is only one
snip!! let us know if you get one in your hand with the right date
code
then we can guide you from there...

Here you go !!

Police stations:
A - Central
B - Southern
C - Potrero
D - Mission
E - Northern
F - Park
G - Richmond
H - Ingleside
I - Taraval
J - Tenderloin Task Force

Police Frequencies:
PIC #1 460.225 G, H, I
PIC #2 460.125 C, D
PIC #3 460.500 A, B, J
PIC #4 460.075 E, F
PIC #5 460.450 tow desk
PIC #6 460.350 admin
PIC #7 460.525 PT&T (Parking, Traffic & Tickets)
PIC #8 460.550 traffic, MUNI, narcs, vice
PIC #9 460.025 RCLEMARSS

Note: portable UHF radios transmit 5 mhz higher on all duplex
frequencies (PIC #1 through #9)

Police Unit Designators:
1 - administrative
2 - technical services
3 - patrol
4 - special operations
5 - investigations

Units are referred to as R[designator][station][sector],S as
in 3B40.

Police:
Low Band: 45.10 (2nd division: Mission, Ingleside, Taraval)
45.14 (Citywide)
45.58 (1st division: Potrero, Park, Northern)
45.46 (3rd division: Richmond)

UHF: 460.225 (Zone 1: Mission, Ingleside, Park, Trarval)
460.125 (Zone 2: Potrero)
460.500 (Zone 3: Central, Southern)
460.075 (Zone 4: Northern, Park, Richmond)
460.350 (Zone 5: Tows)
460.535 (Zone 6: Tactical)
460.525 (Zone 7: Special operations, transit)
460.550 (Zone 8: Administration)
460.025 (CLEMARS, mutual aid, task force, gangs)

Note: The lowband frequencies are used by patrol car radios. The UHF
frequencies are called PIC channels, Personal Instant Communications,
and are
used by portables.

Fire: F1 - 488.3625 (division 1 downtown)
F2 - 488.5625 (division 2 northwest)
F3 - 488.7625 (division 3 northeast, southwest)
F4 - 489.1625 (primary fireground)
F5 - 489.1875 (arson squad, admin, fireground secondary)
F6 - 489.1125 (citywide emergency)

154.280 (mutual aid)
154.295 (BART)
489.1625 (BART, link to Oakland FD)

EMS: Dispatch - 155.385 (primary), 158.760 (secondary)
Coord 1 - 462.950 (MED 9)
Coord 2 - 462.975 (Med 10)
EMS also used Med channels 1-8 referred to as "MEDCOMM"

Transit:
Channel A - 484.6625 (cable cars, light rail)
B - 484.5125 (cable cars, trollies)
C - 484.5625 (citywide)
D - 484.6125 (trollies)
E - 484.7125 (buses, trollies)
F - 484.7625 (citywide)
G - 482.8875 (buses, trollies)
F4 - 30.74 (bus supervisors)
- 31.14 (inspectors, also 30.74)

BART: F1 - 160.410 (control) F1 - 453.150 (police)
F2 - 160.860 (admin) F2 - 453.425 (police)
F3 - 160.455 (safety)

Moscone Convention Center:
Operations - 461.700, 461.975, 462.0875

Candlestick Park - 151.805, 151.775, 153.875

Coast Guard:
Port operations - 156.600
Navigation Control - 156.650
SF Bay Patrol - 157.050
Operations - 157.100
Law enforcement - 164.550, 164.9125, 353.900
Tactical - 165.3375, 165.5625
Search & Rescue - 237.900
Air operations - 381.400, 381.700, 381.800 (primary)

Port of San Francisco - 453.2625, 464.4625, 861-865.9375

Golden Gate National Recreation Area:
Rangers - 164.800
Park Police - 163.150, 163.525
Fish & Wildlife - 164.800, 408.675

5098. Re: What is Duty Cycle?

Newsgroup: rec.radio.scanner
Date: 1997-06-20 00:00:00 UTC
From: Thomas Hall <XtjhallX@XitisX.XcomX>
Message-ID: <01bc7cb6$99b50240$274543cf@hooded-claw>
Source record: 193871

Duty cycle is the percentage of time a device may be operated. For instance, something with a duty cycle of 50% should be idle for 50% of the time. (e.g.On for 30 seconds off for 30 seconds.) I'm not certain how long a particular device may be operated steadily before it must be idled. Err on the side of caution.

Message-ID: <01bc7d70$05f32040$ba5aba97@caffeine>
Source record: 193879

We have a small national guard base here in West Bend, WI.
About 25 miles NNW of Milwaukee. Strictly helicopters,
no fixed wing aircraft. Anybody know what frequencies
are typically used?

kevin.jessup@mail.mei.com

5107. Digital data

Newsgroup: rec.radio.scanner
Date: 1997-06-20 00:00:00 UTC
From: Ernesto Hufana <hufanae@csus.edu>
Message-ID: <33AA6C76.40BA@csus.edu>
Source record: 193880

For educational purposes only....
I'm trying to see if my comparator circuit works.

Using a pro-2026 scanner. Is this scanner good enough for data capture?
I'm converting the raw signals from the discrm. in series with a .22 uF
cap to TTL signals. (0 to 5v)

Using a basic comparator setup. The ref volt is at about .5 V or less.

I'm currently using a o'scope to see the data but since data is changing
continuously, there is no way i can see if my circuit is really working.

I want to see:
1. The data transmitting at 10 MHz
2. The duty cycle is correct. about 50%.

Now what should I use in order to test my comparator circuit?
Is the digital analyzer the only way to go? I never used a Digi Anal.
before. And it's very difficult to get my hands on one anyway....:(

5108. Re: Trunk Tracker question about channel assignments

Newsgroup: rec.radio.scanner
Date: 1997-06-20 00:00:00 UTC
From: "Neal R. Fildes" <fildes@att.com>
Message-ID: <5odrrr$576@newsb.netnews.att.com>
Source record: 193881

please educate us more on these...

in the US, the mapping for channel #'s supported by the corrected
trunker.exe
appears to work up to the point at which cellular has taken over, so that
is not
a problem here... And obviously, it does not do it for 900mhz band, but
neither
does the 235. so, please give concrete examples of cases
where the trunker algorithm fails or what the frequency 'maps' are (might
they be internationalizations?) I've used trunker to sop up 9 different
trunked
systems so far, with no failure to map channels correctly...

Also, please educate us on what a "splinter frequency" is, now that you
have raised the term to visibility...

THANKS!

A "big brother?" If you mean anything larger than a handheld, it wasn't in my recent catalog. It does have Aviation UHF coverage, though.

In any case, it is strictly an aviation scanner. It seems to me that one could make the case that it is not a "police scanner" because it is incapable of receiving "police frequencies" (or even FM, for that matter). Furthermore, one thing the States can't regulate is the use of this sort of thing on foot or in an aircraft. The FCC will eat them for lunch if they try anything that crazy.

So lock it all up in your trunk, and while you contemplate the silliness of this situation, maybe you can think of a letter to the state legislature which can politely explain to them just how stupid this law is...

It is commonly known that the US Government (You pick the branch) does
have a means to monitor CRT emissions and recreate the display from a
fairly long distance (miles) and that the fingerprint of each CRT (even
if same brand and model)displays enough difference to identify a single
emission.

Scary, isn't it!

Hardline is best, but costs are extremely high. If money is no object,
then hardline or semi-rigid is the way to go. Use Belden cable. Radio
Shack cable doesnt last as long, in my experience.

If your antenna is 50 ohm, Use RG213 or the best RG8 you can find.
If your antenna is 75 ohm, Use RG-11.

If the antenna is 300 ohm (like most TV antennas), your best bet is
a ham radio quality 4:1 balun (dont use those cheap tv ones) and
RG-11 cable.

A lot of departments use more than one simplex freq. You may hear something
like "go to channel 1, channel 2," etc. The town police here switched to a
trunked system a while back.

I live in an apartment complex on the ground floor. I want to be able to pick up freqs from 25-2500 MHz while indoors. What suggestions do you have for an antenna? I currently have a shortwave antenna and the telescoping antenna that is center loaded. What else can I get that will improve my reception? I cannot put any kind of antenna on the roof (bummer). I do have a porch area that I could put an antenna.

Wow, if you were putting the Scout's antenna right *against* a
transmitter's antenna, you may have very possibly blown the Scout's front end.
This would certainly account for the lack of sensitivity you mention.

Doh!

Picture this: Father's Day, just finished seeding a newly regraded area of my back yard, scanner leaning against neighbor's fence. I thought to myself "I'd better remember to pick up that scanner BEFORE starting the sprinkler. Well, guess what? I noticed the scanner there as I was heading back to the garage, after about five minutes of getting watered. It didn't grow.

Needless to say, I immediately opened it up and disassembled as much as possible. Not a drop of water inside! The rubber keypad protected the front circuit board and the leather case protected the earphone and power jacks. The unit was surprisingly easy to disassemble---back case comes off with four screws, rear circuit board connected to front board with a DIP header, front board has six screws into front case and traps the keypad membrane. Speaker is held in place with two screws and a spring steel retainer. Total disassembly, dry-off the keypad, and reassembly time approximately 20 minutes. And it retained the memory!

Nicely designed, built and robust scanner.

Does anyone have information on the two daughter cards that mount onto the OS535 Card? They are the Data Demodulator Daughter Board and the Cellular Hardware Key. Upon close inspection of the board I noticed that most of the holes reserved for these cards are connected dirrectly to ground (-) on the board. The exception to this are two of the holes for the cellular hardware key, which seem to connect to the micro processor.

For educational purposes only....
I'm trying to see if my comparator circuit works.

Using a pro-2026 scanner. Is this scanner good enough for data capture?
I'm converting the raw signals from the discrm. in series with a .22 uF
cap to TTL signals. (0 to 5v)

Using a basic comparator setup. The ref volt is at about .5 V or less.

I'm currently using a o'scope to see the data but since data is changing
continuously, there is no way i can see if my circuit is really working.

I want to see:
1. The data transmitting at 10 MHz
2. The duty cycle is correct. about 50%.

Now what should I use in order to test my comparator circuit?
Is the digital analyzer the only way to go? I never used a Digi Anal.
before. And it's very difficult to get my hands on one anyway....:(

I've heard this one in at least three different cities:

Car 1: Car 1 to HQ, call me a wrecker.
HQ: Car 1, you're a wrecker.

Then there was one I heard years ago in Athens, Ohio:

Dispatch: Athens to Athens 3
Athens 3: Go ahead.
Dispatch: Athens 3, is this the chief?
Athens 3: 10-4
Dispatch: Athens 1, go to XXX to see the woman about a dead dog in front of her house.

In the early 70s, I worked for a newspaper in Gastonia, N.C., where most of the auto license plates started with CL-XXXX. One of the first things I did was install scanners all over the place. One of the old-timers came up to me about a month later and said, "I've lived in Gaston county most of my life and I thought I knew just about everybody, but there's somebody the cops keep talking about that I've never met."

"What do you mean?" I asked.

"They keep telling the officer to go see Charlie L. Lincoln and I don't know who the hell he is."

My fed book says:

West Bend Muni Airport, WI

Army 40.80, 41.60, 241.0

Now you didn't include the name of the Fort or Camp so that is as close
as I can come right now. Email and I can look more.

Ok, I realize that this may be a redundant question, BUT... here goes
anyway, I am going to buy 2 scanners, 1 base, 1 handheld, my question
is, Which scanner to buy, I want to be able to scan cellular on both,
and at this point, money is no object. I just need to know what to get,
and if modifications are available (or needed) and I buy from a supplier
overseas, where there are not many bans on scanners? help!
thanks!

Hi. I don't know much about scanners, but last night I
open up regular AM/FM radio modified it. It know can
pick signals from the Vancouver RCMP, Canadian Airlines, and
some sort of cellular messaging service.

Can anyone tell me what frequencies these might be.

> then we can guide you from there...

Another suggestion is to look for a used pro2006. Too bad
they can't be purchased new anymore. They are great machines
and easily modded. You will get very bored with cellular
real quickly anyway.

The pro34 can be modded, but it is kind of a pain in the ass.
All you have to do is snip a little diode, but that diode is buried
so far up inside the scanner that if you haven't messed with
stuff like that before it could take you a few hours. If you are
good at that kind of thing, then it could take you 15 to 20 minutes.

Digital PL is available from just about all radio manufacturers anymore, plus a few outside companies. Communications Specialists for example has add-on boards to generate and detect DPL, there are others which offer similar boards. The same companies also offer readers with displays to show what DPL codes are on a given channel. It is a little more finicky than normal analog PL and offers more code combinations, but works just as well in most cases.

AT the local hamfest here in Atlanta I saw a CDROM from
Scanner World (?) or some such. It is supposed to be some
kind of frequency data base for scanners. I already own a
PerCon CD. Does this other CD have anything useful or is
it just a duplication of what I already know?
There were two versions of this CD one waa apperently for
old dos and the newer one seemed to be for windows.

In article <txjones-
ya023480002006972202130001@news.transport.com>,
txjones@tranxsport.com says...
> I'm also wondering if the battery in the radio will charge off of the
> transformer alone, when the radio is turned off, but the transformer is
> still plugged in, when jacked directly to the radio. After all, the radio
> is 'off', when charging off the charger cradle unit.
>
>
Say what?
You can charge the trunktracker while listening to it.
I charge the one I bought while I am driving around town
as well as the spare pack using a comaptible DC plug off
the lighter. I figured since the output of the AC adapter
was 12 volts 12.6 to 15 volts would not matter to the
charger unit. Everything must be plugged together tightly
or the red led will not light.

BTW I found the raw nicads that Uniden used today at the
Atlanta hamfest. They were two dollars each with solder
tabs on each battery. These were the same color and
everything. They are listed as 800 milAH AA Nicads. BTW I
discovered why the strange battery pack arrangement. Take
four AA batteries and try to put them loose in the 235xlt
battery compartment and then close the cover. Do you see
'the light'? The only thig keeping me from rolling my own
battery packs is that funky connector you need to plug
into the 235xlt. The guy selling these parts is a battery
salesman from Iowa I think. He has a page on the web but
I threw away the address. I may have one of his cards in
the van. It was Falkner Enterprises as I recall.

I bought some 1100 mah AA rechargeable batteries from him
for the AR8000 at $2.50 each. These probably could be
also soldered together and placed in the 235xlt. Since
these are new technology for me I want to try a few first
and see exactly how they differ from nicads. I understand
these latter batteries loose their charge at the rate of
10 percent a day. :>(That may outweight all their
advantages as I only work four days a week.

E-mail Edward Cox at i2567@netnitco.net
He has an interesting mod where he takes a 2042 and puts a 2035 logic board inside of it. Then he sells the 2042 with the 2035 logic board in it to an unsuspecting person for the price of a 2042. Pretty neat Huh? (unless you are the person he sells it to)

Even the NGs catering to professionals (e.g. comp.lang.java) (as opposed
to hobby-oriented NGs like rec.radio.scanner) have a lot of bickering,
personal attacks, etc.

Something about the anonymity of newsgroups seems to bring out
the worst in people.

\Try a discone antenna... irregardless of brand. In your situation, you

should use the very best coax cable that you can afford, and keep the
run as short as possible. Don't bother with the cheap thin stuff.

You already will be a little weak on the recieve end of things, don't
need to add any more attenuation at any point in the path of the signal
from antenna to scanner.

Keep the discone away from metallic/conductive objects if at all
possible.

Good luck

The last time our freq group got our hands on a mil ship radio, it was an Motorola Sabre. The ship was visiting Vancouver, BC for some reason about 2? years ago. The crewman let us key up & Opto the first 4 freqs until someone else got wise and grabbed the radio back... using 140 MHz area, if I remember. When we punched the freqs into the scanner, they were all encrypted.

The other thing they were using were normal Marine VHF hand-helds.

I need help setting up my scantenna. I have one of the Radio Shacks scanner antenna on my roof, but want to get a scanntenna with it. Will there be any interference between both of them? And I want to get a Antenna Switch so i can hook Two scanner's to the Scanntenna, will this reduce scanning coverage? Also What adapters Do I need for the Scanntenna, and the scanner's and the antenna switch? I want to get the RG-6 because it has the least scanning coverage lost, I want to get the adapters that do the least scanning coverage reduction. If anyone that could help me please!!

5198. Re: Best Cable for a Scanner Beam?

Newsgroup: rec.radio.scanner
Date: 1997-06-21 00:00:00 UTC
From: John Griffin <jpgriff@worldnet.att.net>
Message-ID: <01bc7de4$031d5240$aac174cf@default>
Source record: 193794

George:
If you're planning to monitor VHF or above, there's really only 2 choices, 9913 or
RG-6 coax.
RG-6 is 75 ohm cable TV coax which has slightly more loss than 9913, but it's alot cheaper and it's easier to work with than the bulky 9913. The Scanner Beam is configured with F-connectors, so you won't need adaptors with RG-6.
The 9913 is 50 ohm coax. It offers the lowest loss of any "flexible" cable.

If you are planning on using your antenna/feedline for receive only, then you needn't worry about 50 vs. 75 ohm. If you also plan on transmitting with your the Scanner Beam, then you should opt for the 50 ohm 9913.
Good luck and strong signals!

Generally, about 3 blocks with a normal sized antenna. For the 25
channel cordlesses, anyway, the 900 MHz get alot better range.

5206. Getting computer/scanner to live together peacefully?

> anybody know about when the aor ar16 is coming out eeb has it in there
> catalog and being delivered jan. 97

The Project would appear to have been scrubbed some time ago. Initially I think it was hoped it would be available at a similar time to the Standard AX400 when that came out in Japan however for whatever reasons it never appeared and as time went on the AR16 never became a production project, as to anything else up their sleeve...??

The Standard AX400/Welz WS-1000 is still about the smallest "scanner" around although Yaesu's new VX-1 Dual Bander has 76-999MHz receive, is *very* tiny, has Windows programming capability and powered from a rechargeable Lithium Ion Battery.

> GREATLY appreciated. Thanks.

I have a Pro-60, Pro2035 & 2006 (equipped with Opto boards), and a
BC-200.

I get NO INTERFERENCE using both my external discone, or set-top
antennae. Note that twon of my radios are directly connected to the
computer itself. I am running a Dell 200 MHz Pentium w/ a 17" Sony
Trinitron monitor. The 2035 is sitting on the CPU. <G>

My experience is that cheap computer-show style clone cases, and
off-brand motherboards seem to cause the most problems. This is where a
true FCC Class B approved machine matters. An external antenna may help,
as will properly grounding and sheilding all computer equipment, and
installing ferrites on all your cables.

With the Dell, I have done nothing more than plug it in, it came from
the box with true FCC class B RF performance. My old machine was a Zeos
486, and that did ok too, but not as good as the Dell.

From: Greg Sue <polrbear@direct.ca>
Message-ID: <33ABD093.238B@direct.ca>
Source record: 193810

I get no interference between computers and scanners, but I do get interference between the PRO-2005 and the PRO-2006 when they happen to land on the same or certain other freqs (they are stacked; I'm sure that if I rearrange the layout I can eliminate it... but then it wouldn't look as neat!). I am running an external 800 MHz ant on the PRO-2006, and a 1/4 wave ground plane inside with the 2005.

Sometimes I get interference from one of the colour monitors on HF.

If you are experiencing interference, try outside antennas, using decent coax. For long runs (outside antennas), I use RG-213 (the real thing, not RG-213 "type"), and for short runs (inside antennas, patch cords) I use Larsen DS (dual-shield, stranded RG-58 size).

Use shielded cables between scanner and computer.

Make sure everything is grounded.

Try rearranging the computer and radios, and re-routing the cables.

If you can solder-up a two IC circuit, you can build my computer interface project for about $12.00. The win3.1 and win95 SW lets you save and manage a frequency database(s) and multiple channel maps that can be downloaded to your scanner and saved in its memory. Drop some mail if you are interested.

First thing to do is put up a good outside antenna as far from the =
computers as practical. Use a good double shielded coax to the scanner. =
That may be enough. Other things to look for include:

Make sure all peripheral cables are shielded, especially printer cables. =
Many old ones weren't

Always have the cover on the computer when operating the computer and =
scanner. The metal acts as an RF shield.

Us a surge protecter that also has rf filtering. Helps keep noise out of =
the power line.

Don't plug the scanner into the computer surge protector. Use a =
different outlet/circuit if possible and use surge protecter with =
filtering for the scanner.

The biggest help will come from the outside antenna.

I use two different mag-mount mobile antennas for two different
scanners - the Radio Shack mobile mag and an Antenna Specialist
(MON-52 I think, the id info rubbed off) Of the two the Antenna
Specialist works better. You don't need to mount them on a magnetic
surface, tho a ground plane should help reception. If you can put one
on your patio on a piece of metal (cookie sheet, large pizza pan), it
should work fine for you!

Hello Dave

I did this article a week or so ago for a European Scanner List. I hope you may benefit or get some ideas...

To the good folk in the US of A, please note that references to "RS" is NOT a reference to Radio Shack. It is a reference to an English Component supplier to the trade: "RS Components Ltd" - Do not try quoting the UK "RS" part numbers to the USA "RS" as the results are likely to be interesting!

>Is there anybody that can help me to solve this problem?

>I have a YAESU FRG-100 receiver and a PC Pentium100;
>when PC is on, FRG-100 receives computer-noise so I can't use my RX.
[snip]

I am not familier with the FRG100 but it does not really matter as the theory will be the same for all radios.

It is a very hard one to be specific about because just about every installation is unique. I cannot pretend to be an expert on this subject but I have done a few things to reduce the noise from my machines (486dx2/66 & Pentuim200mmx - the latter has some horrific RF signals in unwanted places!)

The following is not all that can be done to improve things and I am sure that many others can add ideas and practical advice to some of the things I suggest.

To be able to do something practical about your individual situation, you should understand what the noise is and how is effects (gets into) the radio.

Because I suggest doing certain things to radios and computers, I must add a disclaimer: The information included below is given in good faith. However I cannot be held responsible for any damage or malfunction of any computer item, Radio item, electrical item, or any other item damaged or caused to malfunction. The information is given on the strict understanding that no modifications, or suggestions will be attempted unless you are competent to do so and any such action will be entirely at your own risk. All care but no responsibility.

I have tried not to talk dirty (technical) and in my comments some technical wizards could call me to task for over simplifying things. However, this is not a full technical essay - just a pointer or two and the simplified explanations are deliberate for all levels of knowledge to follow (at least that is what I hope!)

GENERAL OBSERVATIONS:

Interference can get into your radio, basically in 3 ways.

1) Via the aerial. Picking up *radiated* RF interference
2) Via the general circuitry of the radio. again picking up radiated interference. (IE an unshielded radio case.)
3) Via ANY other wire or wires connected to the radio. These can act as an aerial and pick up the interference and insert it into the radio, or they can be the carrier of 'dirty' noise from the computer.

These 'other wires' could be the dc power cable in or on the mains cable (on ac powered kit). They could be the ear piece or headphones (both have nice little transducers that can act as rf detectors and a length of cable to act as an aerial!!!) or the wires could be a computer interface or a tape recorder interconnection.

WHAT IS THE NOISE and how does it escape out of the computer? :-

There are several oscillators inside computers and inside the monitor. Each one of them generates a square wave. This square wave is full of harmonics. In layman's terms, they radiate unwanted radio signals on literally hundreds of other frequencies, each one of these frequencies mix with each other so generating even more!!

Most computers (portable/laptops excluded) are in a good metal case and this should go a long way in keeping the noise inside the case but to do this the case lid MUST be correctly earthed (grounded) to the main case of the computer. There are also gaps in the case (slots where you put in a floppy or CD ROM or tape streamer that let the noise out.

You can do a power of good by scraping the paint away from under the retaining screws holding the lid on so that the screws act as a grounding point of the cover to the case. AND use a *new* star washers under the screws so that it 'bites' into the metal and gives a low impedance ground. The more the grounding points around the case the better.

Have a close look at the computer case itself - see if the are any points where you can drill and fit MORE screws that will bond (ground) the cover to the case. In well shielded equipment, screws every 25mm is not too many! But there is a

limit to practicality - for our purpose every 75mm should be OK. If you can stop the noise radiating out via the case, then the noise can only escape from the cables plugged in to it.

CABLES LIKELY TO BE RADIATING NOISE OUT OF THE COMPUTER:-

There is a multitude of cables plugged into the back of the average computer.

1) AC power In. (THIS NEEDS SPECIAL ATTENTION - see below)
2) AC power Out - to the monitor. (some set-ups have the monitor plugged into a separate ac socket)
3) the keyboard
4) the mouse
5) The modem (I should imagine most of us leave the modem plugged in when we are scanning)
6) a computer interface (If you use one)
7) Multimedia connections (audio cables from the computer to the speakers. Microphone/line in cables etc
8) video cable to the monitor. This can be very dirty too.
9) Printer

If the monitor is powered by a separate cable into a separate AC power socket - pay attention to it also.

EACH and EVERYONE of these cable can and do act as a miniature transmitting aerial, transmitting the noise OUT from the computer. The AC power cable IN to the computer, from experience seems to be tha main one that lets the noise OUT from the computer!!

I have fitted a special filtered ac socket on the power supply on the computer - this means taking the computer apart, dismantling the power supply module and removing the ordinary plain socket and replacing it with a hi-grade filtered and screened socket. Th epercieved noise reduction was dramatic. I did not measure the difference but my ear told me that the situation was now quite tolerable!

The actual specification of the filter is 50 db (0.1 to 150mhz)

The filtered socket is made in Switzerland:-

Manufacturer: SCHAFFNER
Type:FN 321-3/05

For people in the UK, the filter is available from RS Components Ltd Part number 238-817, cost 12.85 ukp + vat for a 3 or 5 amp version. (For those outside europe "vat" is a sales tax!)

RS Components Ltd
PO box 99
Corby
Northants NN17 9RS

ph: 01536 201201

I note from the RS catalogue, I see that they also supply a 'patch cable' that plugs into the computer's ac socket and you then plug in the ac power cable into the patch lead. This patch lead has a filtered socket giving 30 db attenuation 0.6 - 100 mhz @ 50 ohms. RS part number 238-558 'Lead with inline filter' @ 11.90 ukp + vat This may be a better bet for those not happy to take the power supply module apart!

For those with RS catalogues - check out section 25, "Suppressers/Filters/Shielding" - Some very interesting goodies.

I then fitted EVERY cable with a ferrite sleeves. (Have a look at your video cable that is plugged into the computer - see that lump neat the plug? That is a ferrite sleeve.

In layman's terms, a ferrite sleeve acts like a pair of hands strangling someone. Imagine the noise thundering along the cable out from the computer, when it reaches the ferrite ring or sleeve, it is throttled to death! or at least greatly reduced.

You need to fit the ferrite sleeve or ring as close to the plus going into the computer as possible.

Again, for those in the UK, RS Components types:

779-829 4-5 mm diameter cable
779-835 5-6 mm
779-841 6-7 mm <----- I used this size for ALL the cables inc mouse!
779-857 7.5-8.5mm
779-863 9.5-10.5

They are 'split' type and are snapped onto the cable like a handcuff. You do NOT have to take the plugs off to fit them.

779-829 3.11 ukp each + vat
779-835 3.20 ukp ea
779-841 3.20 ukp ea
779-857 3.48 ukp ea
779-863 7.30 ukp ea

Note: The RS book I have at home is FEB 96 so there might be a slight increase in prices, but I show the prices so that you can get an idea of costs involved.

REDUCING THE RADIO's SENSITIVITY TO COMPUTER NOISE

1) separate the radio and computer as far as practicable.
2) If at all possible use an external aerial with good quality coax feeder AND good quality termination plugs. This will help to increase the wanted signal and decrease the unwanted signal (noise)
3)Screen the radio and RF decouple every wire (except the aerial) going into the radio. This is not very often easy nor practical. It entails putting the radio in a metal case (if it is a plastic cased radio) and the RF decoupling is easier said than done too.

In theory, the radio can be placed in a good metal box or case and only allow and aerial connection. This is however not very practical because of needing to easily gain access to minor little things like the tuning, volume - see the dial and most of all, hear the darn' thing!

There are proprietry conductive screening paints available that can be sprayed on the inside of plastic cases. Again, this is not practical for several reasons - The radio has to be totally stripped out from the case - the case, has to be masked where you don't want paint (like the plastic window!). The paint is very expensive (RS shielding aerosol part number 568-483 costs 16.25 ukp plus vat for a 400 ml tin. AND it carries a health warning: "Caution: This product under EEC classification is classified as 'May Cause Cancer'" The paint has relatively good attenuation starting at about 36 db at the bottom end of the radio spectrum to about 50 - 60 db at 1000 mhz.

In real terms, the most practical advice is:-

* Put a decent external aerial on the radio. If possible match the aerial to the frequency band being monitored.
* Keep the radio as far apart from the computer as possible and practical.
* The best and quickest results in gaining a better signal to noise is to work on the computer.
* Daft as it may sound, switch off the computer if you dont need it on at the time!

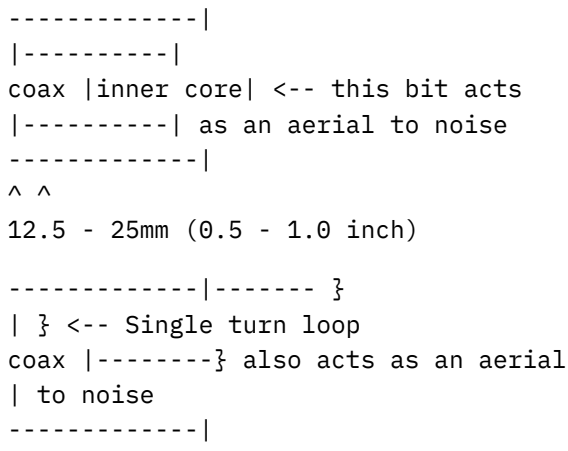
Also if you can, plug the computer into a different AC supply socket to the radio's supply socket (AC powered radios and battery chargers)

A NOISE SNIFFER

a small gadget to help in tracking down noise can be made from a few feet (say one metre) of coax cable plugged into the aerial socket of the radio....

Obviously one end of the coax should have an aerial plug on it the other end can be fashioned into either a tiny aerial about 12.5 to 25 mm (half to one inch) long or a single turn loop of hook-up wire connecting the inner cable to the outer screen. the loop to be about 12.5 to 25mm in diameter (The actual size in not critical)

(View ascii drawings in fixed font if they look odd!)



Make sure that any exposed conductors are insulated.

To use the 'sniffer', plug it into the radio, switch on and tune to a frequency that is not occupied be a regular radio signal but does get interference from the computer. Make sure that the squelch of the radio is wide open so that you can hear all the radio hash, even with the computer switched off.

Now use the tip of the 'sniffer' like a wand and wave it near and along the various cables going to and from the computer. This will possibly help in identifying the real noisy ones.

(In my lab, I have a whole range of different sniffers right down to a stubby 3 mm tip - with this, it is possible to "see" a signal at the base of a transistor and then to see if the signal is bigger on the output of a transistor - it is not difinitive but a quick way to see if a tx transistor is stuffed or not!!!!)

With the suppression action take above, and with the exception of certain spot frequencies, I have th noise level down to the point that If the signal does not get past the noise, then switching off the computer is not going to make it better!

One final caution: any of the above suggestions could cause any warrantee of the radio or computer equipment to become null and void. Contact your supplier and check this out BEFORE mods are done to expensive computers/radios.

Other than that - have fun - It's all part and parcel of the hobby.

Regards

Donald Gray G3YPL/exZL1AZC

George, Try mounting a preamplifier at the antenna (Grove Radio) and that
way you will not need to worry about cable loss at all. If you transmit
this will not work.

I have a PRO-2006 scanner (modified for cellular) with the Optoelectronics OptoScan/456 computer interface board installed. It comes complete with mag mount antenna, all required cables, original manuals, shipping cartons, and Probe ver.3 software package. This radio looks and works like new.

I will ship it all for $450.00

I also have a Optoelectronics Scout mod 40, and the Optolinx interface unit. This was all purchased new in April, 1997.

I will ship this for $325.00

I'm using MS Excell to keep track of TT groups. Found an interesting feature to get the Motorola Hex numbers. Use the argument DEC2HEX to convert a TT group number to hex and HEX2DEc to get the TT group if you got your hands on a programming printout from the radio shop. Anyone else doing this? E-Mail please.

To all:

Hello! My name is Chris Halladay. I live in the San Francisco bay area. I would like to request that someone email me a list of frequencies used by the news media here. I have a list, but it is a couple of years old. I am not sure how current it is. My scanner is a Realistic Pro-34 200 channel hand held programmable. It can handle the 900mhz band. I live at the top of a hill. I can monitor most of the bay area.

Thanks in advance!!

Don't know if this will work on a base model, but it works for the handhelds. Turn the scanner off, while holding down the #2, #9, and the manual keys, turn the scanner on. This procedure will erase the memory on Uniden handhelds, never tried it on a base. Good luck.

Don't know if any mods are available, but I do know that cellular cannot
be resotored to this unit, you may be able to monitor cell via imagaes,
but thats about it.

I think it may depend on your area. The EOC here in the county I
live in transmits the messages through 2 paging companies. I'm sure
there is some kind of an arrangement to offer this service between the
companies and the EOC. There may be something similiar in your area.

Another method that I have considered is through one of the online
service providers. CompuServe offers this; not sure about AOL. The
idea is to sign up for their pager service that will page your
alphanumeric pager with stock quotes, e-mail, weather, news, etc. and
display it on your pager. There is a section for severe wx alerts on
CompuServe. Just tell CompuServe you want wx alerts sent to your
pager and it will do it automatically.

Thanks Greg, I understand what your saying. It did not think of that
maybe because I've stuck to working with only the Canadian Band Plan.
Too bad. maybe further versions will let you select different or offset
the list and save the hassle of having to enter all the frequencies.
I'm sure its still a bit of number crunching and steps to find the
closest match as it is.

Thanks for taking to time.

NO Kidding Bud. I thought the trunk tracker was a car
accessory....thanks.

You failed to understand the subject here Bud. No one was talking
about any radio assigning its own frequencies. You do not understand
the terminology, YOU MISSED THE SUBJECT BY A MILE. Your reply serves
no purpose and refers to a Spectra radio that is irrelevant here. Heck
you might as well talk about drinking water your so far off. Worst
part is you resorted to Name Calling. Lets say for a moment that I
was way out in left field Bud. Do you not think it would be better to
shut up or correct me and contribute to the newsgroup instead of taking
away from it?

Your kind of reply is not welcome here and serves no purpose.

If your shooting off your mouth don't aim at your foot.

Hi.
I'm kind of a scanning newbie. I want to know what MODs (modifications?) I could do, what they do, how to do them...etc.... And could anyone give me some good news about having a Radio Shack 50 channel scanner? It also covers the 900MHz band (that's good right?). What could I do with this besides listening to the cops and cell phone calls? Would anyone reccomend any books or equipment? Anyone have any stories to share? I just want somebody to explain all the cool things I can get my scanner to do, and that kinda thing. Please write back soon.

I've got a Uniden BC-100XLT that I'm attempting to revive. Symptom is very low audio output, distorted, etc.

I'm guessing a cap in the audio amp has died, but I don't have a service manual, and they're fairly expensive (Uniden charges an arm and a leg just for shipping).

I notice a 100uF cap on the keyboard PC board that might be the culprit.. Anyone have any clues where the audio amp is in this beast? I attempted to follow traces back from the speaker, but I'm not having much luck there.

Any suggestions before I start shotgunning this thing (ie: replacing caps at random)?

A scanner is something everyone should have! They're great. You can hear
the local events as they're happening and that sometimes don't make the
11 o' clock news. You can also hear beepers, baby monitors, cordless
phones, walkie talkies... I've never heard the FBI because I live in a
rural area.

I've been using the WiNRADiO for several months
now. So far it's not something that I would buy
for myself (my job required a scanner). First
off, using the scanner listings that I already
have on my computer isn't an option without buying
the winradio database (big$). Second, the
receiver seems to randomly start oscillating on
its own, resetting the power works for a while
though it'll return later. The third, and most
irritating problem for me, is the scanner doesn't
have a "sound squelch" to keep it from hanging up
on an unmodulated carrier. (For some reason,
unmodulated carriers around here are the norm.)

BUT... There's some really interesting things you can do with it now. The latest SW version includes a "spectrum anlayzer" which you can choose to save the trace data from. And there's some software to decode pager data and doesn't need external interface hardware.

Source record: 193655

All,

I've recently installed an OS456 lite in my PRO-2006. What I would like is to buy one of the scanner control programs that you don't use anymore. The reason (besides my being cheap) is that it seems everyone is selling programs which will decode CTCSS/DTMF and do spectrum analysis. The OS456 won't do any of that, so all I need is a program which will allow me to take a comma delimited file and start scanning. I just don't think I can justify spending too much more money on this project.

Is this legal?

Is there a better place to ask?

Don

> could help me please!!

if you use rg-6 you should only need a f-bnc adapter at the scanner
end
the antenna uses a 300 ohm connector and has a transformer

this is a good broadband antenna and does work quite well in my opinion

I am happy with mine. I'd even say it's the best scanner I had.
Performance-wise I'd compare it to AOR 3000 but it has many more
features and is much more fun to use.

Pros? Many options and features, intelligent user interface, excellent
design, ability to write your own software.

Cons? It's not exactly portable (which is not a problem for me as I do
not carry scanners around).

Regarding PC interference I didn't experience any problems.
I use it mainly for VHF/UHF anyway.

Regards,
Peter

F O R S A L E

MARACOM M5100 VHF Marine Transceiver ----
5 and 25 watt transmit on marine frequencies.
NOAA weather channels. Digital readout.
Includes microphone, no mounting hardware.
Only $ 60 + shipping in US.

MOTOROLA MTX9000 fm handi-talkie radio,
model H01WCF4DB5AN NX type WCMA.
900mHz range. With charger and info.
Only $499.

PCMCIA Sound Card --- by AMP. Includes software,
cables, microphone.
V-Synth wavetable synthesizer
Wave SE sound editor
Stratos MIDI software
MIDI Tune-Up
Windows Sound System software
Cardsoft Card and Socket Services
Traveler adapter module
Microphone
Compliant with PCMCIA Release 2.1
12-bit recording and playback
5 sampling rates
Turtle Beach Hurricane architecture
Thin-profile Type II card
requires:
Type II or III PCMCIA socket
386, 486, or Pentium processor☐☐
4MB of Ram
$65 + shipping..

------------------- F L A S H L I G H T S ---------------------

4-D cell (2x2 style), krypton bulb. In box, never used.
$5 + shipping.

6-D cell multifunction lantern. Sleek tubular style with
bright incandescent light at end, 6W fluorescent bulb
along bottom, and flashing red and yellow on top. Also
has electronic sonic alarm that can be switched on with
the flashing lights. In box, never used. $12 + shipping

3-C cell Eveready worklight-style. Bright yellow with
hook for hanging, frosted bulb to diffuse light over area.
Unused, but no box. $5 + shipping

Batteries NOT included.....

COCA-COLA caps. Red cloth, white lettering. New.
$8 each + shipping. Only 9 available.

..... FOR YOUR DRIVING PLEASURE .....
1929 Mercedes SSK kitcar on VW chassis. Just completed, never titled.
Yellow, with brown fenders and running board, tan convertible top, side
curtains, and tonneau cover. Gold trim instruments.

COBRA 18-ULTRA CB ---- 40 channel, pushbutton tuning, with 3
NOAA weather channels. Includes microphone, but no mounting
hardware. $ 35.

LEXMARK/IBM PORTABLE PRINTER 5183 ---- powered by rechargable
battery or AC wall adaptor (included), this printer is only
11.5" x 3.5" x 2", and weighs about 2.5 pounds with battery
in place. Using silent thermal print head, it will print on
either thermal fax paper or on regular paper using the enclosed
thermal transfer ribbons. Very quiet in operation, and because
it runs on a battery, it is completely portable, for use with
laptop computers anywhere. Includes parallel port cable. $89.
.
ANADEX WORD-SCRIBE PRINTER ---- heavy duty dot matrix printer.
Multiple ports, but no literature so only parallel port in use
now. Tractor or friction feed. Fast, good quality; 17-inch
platten. $ 15
.
add shipping to all prices, only in US....
if interested, leave e-mail...

In article <19970619232500.TAA13313@ladder02.news.aol.com>, JobasF
<jobasf@aol.com> writes
>What does the term duty cycle mean
>in relation to power supplies and transmitters

The number of minutes of use you can have (at full power) and the number of minutes "rest" (minimal power drain) the unit needs to cool down and be ready to supply full power once again.That is one "cycle". Applying full power again starts another "cycle". Too soon,or too long a full power period and the unit will not have cooled down enough inside and will begin to overheat, eventually causing a thermal trip (if you're lucky) or permanent damage if you're not.
If the duty cycle on your PSU or transmitter is not high enough for your needs, or if you talk too long, causing overheating, you need to consider switching to a lower power output, or buying heavier duty equipment with a duty cycle better suited to your needs. In the case of a transmitter, you could consider lowering Tx power to 1 amp and putting that into one of the small linears you can buy quit cheaply now. Make sure that your PSU can handle the extra load as well. You'll find that everything runs much cooler, and lasts longer.

5276. Re: Weather Alert Feature on BC 890 XLT

Newsgroup: rec.radio.scanner
Date: 1997-06-22 00:00:00 UTC
From: ki4je@bellsouth.net
Message-ID: <MPG.e16ece7e62829539896bb@news.atl.bellsouth.net>
Source record: 193705
Cross-posted to: alt.radio.scanner,rec.radio.scanner

Leave it on all week. The WX service tests the alert system once a week. In the Atlanta GA metro area this test takes place around Wed 11:00AM providing no severe wx is forecast during that hour. Some alerting radios have a lock function that allows you to know the alarm was triped while you were away from the radio. This allows you to check to see if the wx event still bears acting upon. I doubt that the BC 890 has this feature, but if that radio can scan all wx channels and pick out an alert while mobile without your intervention then that is a valuable function in itself and in my opinion would make that radio worth having if you did extensive driving.

Every alerting radio I have seen requires you to tune to the local wx channel first. While mobile you are out of range in about 50 minutes so you have to constantly change this selection. In some locations you can pick up multiple wx sites. During very dangerous times I use two or more wx monitors. You haven't lived until all of them go off at the same time! This happened to me when I had two of them set to the same frequency and a more distant site set off an alert almost within seconds of the local site. My company provides an in dash scanning am/fm stereo radio with wx band. I had set it to scan for the local wx and just tell me what conditions were like. I heard the wx alert tone there also in addition to all the other yelping and beeping from the locking alert receivers! Talk about nerve racking noise!

A related expierence is that I pulled into Hunstville Al and shut off the engine only to hear my case suddenly start yelping. A local wx alert. I didn't even know I had a wx radio in there much less turned on. Fortuantely all that alert was for was to watch out for flash flooding. Duh, heavy rain, location near some mountains, that has to be a no brainer.

Seems a little steep Rick. Yeah, I know it has all those extras, but cellular isn't the only game in town. (In fact, the only time I "used to" listen to cellular was when I was completely bored with all the Public Service bands).I also doubt that you are offering a warranty period, which is pretty nice to have.
It is a good scanner, but not THAT good.

Good luck

Just a reminder that the next Trunk Tracker discussion will be held on
Monday June 23 @ 7:00pm PST.

Who's invited? Anyone interested in radio monitoring especially
trunked radio systems with the new Uniden Trunk Tracker.

Where will the meeting be held? There are two ways to join the
meeting, the easy way (for people not familiar with IRC) is to point
your web browser towards: www.wolfenet.com/~daydream
and click on chat room.
You can also connect using your favorite IRC client (Mirc, etc.).
Server: webmaster.ca.us.webchat.org Channel name: #Intercept

If you are in need of a IRC client, Mirc can be found @:
http://www.createch.net/mirc/

We look forward to seeing everyone at the meeting..

5285. If it works, don't fix it

Newsgroup: rec.radio.scanner
Date: 1997-06-22 00:00:00 UTC
From: "Clay S. Koenig" <cskoenig@iglobal.net>
Message-ID: <5oik6s$9rg1@news.iglobal.net>
Source record: 193714

Hi everyone,
You people are head and shoulders above me when it comes to talking about mods, trunking systems, etc.
I have no idea what I did but it seems to work. I went to Radio Shack bought some kind of antenna that looks like sputnik. and I couldn't install it professionally so what I did was stick the thing in a steel tentpole about 6 foot long, it wouldn't stay so I took a broken piece of wood, layed it against the antenna inserted into the pole, then wrapped the whole thing around and around with packing tape (you know? the brown kind that you tape up packages to ship?) then I wanted to set it on the roof of my house but I'm no ladder climber so there is a spot that you hang flags on the front of the roof of the house? I stuck the pole in there so it really isn't vertical but not 90 degrees either. Probably 45 degrees give or take a few. Well the pole slid through this flag pole holder so I took a couple of nails and drove them through with about an inch sticking out at the bottom of the flag pole holder. So when I slid the pole in, the nails acted as a brace to hold the pole in. I ran some kind of co-ax cable that I got from walmart from the antenna, through my window and hooked it to the back of my homebase scanner. I programmed a bunch of 900 cordless frequencies and I pick up everything and anything. A lot of these calls seem to be cellular but who knows. It's lasted through winter, rain, hail storms, you name it and it still stands. My wife can't stand the eye sore because it looks like trash in the nice neighborhood we live in. I can also hook it up to my handheld scanner that goes up to 1.3GHz and it picks up the cops quite well through the city.
Why am I telling you this? I don't know, maybe some extra input from you scanner guru's can help me with even better reception.

Thanks,
Clayster

5287. Motorola Trunked System Keys

Newsgroup: rec.radio.scanner
Date: 1997-06-22 00:00:00 UTC
From: trunking@hotmail.com
Message-ID: <867006268.7657@dejanews.com>
Source record: 193716
Cross-posted to: rec.radio.scanner,rec.radio.swap

Using the Motorola MTSX RSS v4.00.00 software, is it possible to program a trunked radio without the system key....or to create a "dummy" system key?

I have a system key for one system ...a file called SYSXXXX.KEY (the X's are the system ID) The file is 30 bytes in size.

Is it possible to clone this key using a hex editor? Does anyone know what exact info this file contains? Can it be changed? Could I use this key for other systems and just program the other system's control channels and talk groups?

Any help would be greatly appreciated!!

Thanks!

Hello there,
just wondering if someone could briefly explain the 900mhz phones
Are all 900mhz phones digital? what is spectum?
I want to get a phone that is totally private which ones do you
recomend?
I like the Panosonic style but don't think they are digital.
Thanks for any help you can give me
Russ.

5294. How is Pro-51 at picking up Cellular?

I was going to buy a RS Pro-51 (they are on sale for $199) - I was just interested in finding out how well it picked up cellular phone, cause I'm not sure how that keypad trick works. Anyone who's used this particular model with success, or unsuccess...let me know. Thanks!

Hello fellow group members,

I'm thinking about purchasing a Welz-1000 (manufactured by Standard), claimed to be the world's smallest scanner, with wide coverage and 400 memories. Can anyone comment on this scanner's:
1. Receiving performance.
2. Search / Scan speed.
3. Good and bad aspects of this scanner.

Any help would be appreceated.

Best regards,
techno

(P.S: please email me directly in addition to posting here, so no responses are missed. Thanks!)

I suggest that you get a phone that is hardwired to your telephone
service.

Remember, DONT SAY ANYTHING ON A CORDLESS OR CELLULAR THAT YOU WOULD NOT
SAY IN A CROWDED ELEVATOR!

5302. pro-51 helpme please

Newsgroup: rec.radio.scanner
Date: 1997-06-22 00:00:00 UTC
From: MBuck@pitnet.net
Message-ID: <5oka3m$h68$1@news3.alpha.net>
Source record: 193731

I found this at http://w5gb.nmsu.edu/kc5kto/mods/pro51cell.txt
However it only works on pro-51 scanners with a date code before 7A4.
This document may be freely distributed for all non-commercial
purposes.]

There is an interesting test mode in the PRO-51 that,
combined with the direct search feature of the scanner, lets
you pick up out-of-band frequencies. You will have full
access to the 66-88 Mhz ranges as well as the cellular base
range of 869-896 Mhz.

Actually, there are several test modes in the PRO-51 (most of
these comments should be true for any Uniden-made Radio Shack
scanner, such as the PRO-46). I'll describe them first and
then how to take advantage of one of them to get the
restricted frequencies.

There are three data test modes. These modes completely
destroy any frequencies you had programmed into your scanner,
so it's best to use these techniques before you program your
scanner. If you have already programmed it, you'll have to
decide if these new capabilities are worth reprogramming.

TEST MODE 0. Clear the scanner.

A well-known method of clearing the scanner to all zeros is
to hold down the 2 key, the 9 key, and turn on the scanner.
All frequencies will be lost.

TEST MODE 1. Fill channels 1-25 with test frequencies.

Press the 2 key, the 9 key, the L/Out key, and turn on the
scanner.

This fills channels 1-25 with these frequencies:

1 30.050
2 40.840
3 49.900
4 138.150
5 162.400
6 173.225
7 406.875
8 453.250
9 511.9125
10 108.500

11 118.800
12 127.175
13 135.500
14 66.450*
15 76.825*
16 87.425*
17 157.800
18 482.3625
19 29.000
20 54.000
21 806.000
22 857.200
23 888.96*
24 911.500
25 954.9125

* indicates not within the PRO-51's normal coverage.
If anyone knows another way to modify the pro-51 for cellband please let
me know MBuck@pitnet.net

Source record: 193733

Hi there. I'm sitting here in RF hell Los Angeles. I bought the R10 yesterday and was scarred it would act like the R1. So far it is working great! It seems to have a much tighter reciever and IM rejection. For instance my receiver usually gets wiped out in the 480mhz area and has alot of fading. With this little R10 I have had nothing but quiet reception and no fading at all! I am not even using the ANL/NB and it still is noise free. I also have noticed that it works MUCH better on the VHF low band than any hand held I have had previously. I even tuned in WWV on it last night and it did farely well. At this point I would guardedly recommend it. Good luck if you get one.

10 banks of 100 memories, 1,000 channels, 50KC to 1300 Mhz, unbroken coverage. Programmable for 5 to 50 kc steps. AM, WFM, NFM, SSB, CW. Has VFO for search, and BFO for slope tuning. Comes with rubber duck and long wire. Can tune short wave, AM/FM broadcasts, ham radio, and everything else you can think of - except following trunked systems. This wide range monitor was manufactured prior to the ECPA of 1994.

Paid $489 and will sell for $300 plus shipping. It is ANIB, complete with all factory items. I have had the battery pack professionally replaced by TNR Battery Store with an 800 Mha pack (it came with a 600 Mha pack that failed after 1 year). That's the only change from factory specs. It still has the protective plastic cover attached to the top. In "as new" condition. It is in the factory carry case, no scratches or dents.

Serious inquiries, please.

I know very little about scanners. I read some general info on the web sites. I was wondering if maybe some of you guys/gals who are involved with scanners could help me out. I live in the suburbs on New Jersey (Bergen county). I'm considering buying a scanner. I'm not sure however, whether the idea is worth it. I was hoping someone could give me a general idea what type of stuff can typically be picked up on a scanner (esp. in a suburban are that I live in). I.E: I hear about the ability to listen to police/FBI/Air traffic Control, breaking news stories live. How accurate is this perception that using a scanner, I can pick up all kinds of fascinating and exciting frequencies? Really apreciate any help or info you could provide. Thanks

Bub...oh, Bud. sorry.

bud...the katzman's wordage could have read as follows:

"Bub, oh, Bud. sorry." We have here a situation where your
understanding about TT is not completely in tune with the facts as
printed out in postings and articles on the net. Bub, oh sorry, BUD,
the subject of radios assigning their own frequencies does not apply
to the TT. Some where you have inferred the wrong info as given you.
I am sure the terminology is there in front of you and you do read it
well. But what you are reading does not keep pace with the way in
which TT's operate. That other radio idea mentioned , the Spectra,
is nice, but could be stated more accurately if you had more facts
which I have and you need to get from me at my pleasure. I'd be more
than happy to spend another moon with you to help you understand the
many intricacies which only I understand. As for drinking water, what
brand do you buy at your store? I wonder if we share similar tastes.
The names called can be similar and dissimilar and for the most part
do not apply in this case. I am sure you can find other venues to use
those words and be assured I welcome this for you and your piece of
mind.
I would hope you can be amenable to my position and listen
a bit more. No need to yell and shout and call names and tell you to
shut up just so I can get my rocks off on my terms. I want to know more
about you Bub...ooops, Bud, sorry. Help me understand you by answering
me when you are relaxed and not in such pain. i really appreciate what
you have to say to me and to the group and I want you to open up and
let it all out Bub...ooops again, BUD...sorry.

Allow the good vibes to flow. Have a few good inhales and then
get back to me and we can take on a whole new "e-mail"
interchange that the whole group will praise you for having
with me. I want you. To openly come and give forth your
fullness of mind.

We need more contributors as you and with a little bit of
understanding on my part and our part you will be welcome

anytime to the commentary most make on this group.

I have nothing against you being footloose and free of thinking
that all things are nothing without attaching a name to them.
but in the future your reading audience will apprecaite you
more if you just show that you can really concentrate on how I like
things to be in my world BUB...ooops, BUD...sorry.

sign off as who wrote the below.

You failed to understand the subject here Bud. No one was talking
>about any radio assigning its own frequencies. You do not
understand
>the terminology, YOU MISSED THE SUBJECT BY A MILE. Your reply
serves
>no purpose and refers to a Spectra radio that is irrelevant here.

From: rlcooper@annap.infi.net
Message-ID: <5oi5u4$i8e$1@nw003.infi.net>
Source record: 193774

Hello,

I thinking of selling my BC200XLT. It is in good condition, includes two battery packs, charger, original antenna plus an extra, original protective case plus a professional quality leather case and the original box. It has been modified for full 800 mhz coverage.

I was thinking of asking about 175.00 which seems like a steal but try telling someone new to the hobby this when they read a Radio Shack ad for a new scanner for 199.99 even though it does not include batteries, charger, protective case(s), and can't tune the full 800 mhz band.

Anyone sell one of these lately? I'd like to hear from you.

Thanks,
Rick

These are what is known as IMTS (Improved Mobile Telephone Service) phones,
the predecessor to cellular and trunking.
They most commonly use 152/157 Mhz (Base/Mobile) or 454/459 Mhz. There also
is some low-band frequencies assigned for such a purpose, but I know of no
such systems on low-band.
These are characterized by a 1070 Hz (?) Idle tone and AFSK pulse dialing
(I would have to get out my reference information to give you the exact
protocol).
The most common phone still in use there seems to be the Motorola Pulsar.

I need to find out the Bearcat Version of this scanner
It's a 18 ch Montgomery Ward Edition
Made by Bearcat/Electra
Numbers on unit are as follows
Model-GED 835A
Mfg-7-80 this was easy july,1980
Has this # also HC-604
Ser# 20090
Following buttons are on keypad
7 8
9 Time Delay

4 5 6 Speed Lockout

1 2 3 Limit/Hold Scan

0 * E Search Manual
Keys are easy to figure out
except for Time? It cant be
set but seems to be a timer to display how long scanner has been on. E
hour.min.sec

Any help would be Great

Q: I have a BC 890 XLT scanner with the weather alert feature an so far it has never gone off ?
i know be glad it hasn't right :) But really the weather service has posted alerts for Severe Tstorms an i have
never had the scanner trip ? Has anyone had the same problem or is there a way to check the Freq for
the weather service to trip the alert feature ? I was told by a Ham Operator that weather service uses the
same alert freq. across the country, such as TX,FLA,CA,NY etc. Can anyone tell me if this is true.

>
> Greg Knox

I take it from remarks not included above that you helped design
the Trunk Tracker?

I have done some limited work with trunked mobiles and the above
statement puzzled me, since I have never needed to specify a
channel plan while programming radios.

So, I asked a friend of mine with about 15 years of experience
in installation and maintenance of trunked systems and mobiles
and portables. He said that he has never heard of different channel
plans being used in Motorola trunked systems. In fact, he pointed
out that Motorola uses F.C.C. channel number designators and this
is a fixed and unchanging set. I'm curious what the truth is.

I suspect that the "other issues" sounded like sharks threatening
to sue if the Trunk Tracker had been designed for ease of use.
That's my guess, anwyay.

So, to restate the question that I never got answered last week,
the final word is that you must enter all frequencies associated
with the trunked system in order for the Trunk Tracker to hear
all traffic, yes?

Thanx!

Bote

Stop into Radio Shack and pick up Police Call Plus. Lots
of listings for frequencies in your area. Look up local
agencies and punch in their frequencies to see who is active
in your area.
For a listing of all the different types of agencies who
use radio, try this web page

http://www.qsl.net/n2mca/SERVICES.HTM

You might also want to look at two other pages of mine
which I designed with new users in mind

http://www.qsl.net/n2mca/STARTING.HTM
http://www.qsl.net/n2mca/NEW_USER.HTM

Also, you might want to poke around my Scanner Dealers
FAQ and take a look at the dealers that advertise on the web.
Many of them have radio specs, books and accessories to sell.
Just take a look at my web page below and click on the Radio
Monitoring link and take it from there.
Good luck!

Strong signals,

I think the best ones I ever heard were both on the same night, two
different city police departments.... first one was a call from a man
complaining about a couple of people parked on his private road and
when he asked them what they were doing they said they were hunting
rabbits.... so the police go out there expecting to find armed hunter
types and when they got there it turned out to be a couple of CBers
participating in a rabbit hunt.... later the same evening a call came
through in a different city, a woman had called because there were
voices coming from her tv even though it was turned off.... they
wanted the officer to go do a mental health check on her. Officer
called back in verifying that there were indeed voices, again, CBers.
And I figured out exactly what was happening before the officer even
reported in in both cases.

> could you also point me to another FAQ.

Unfortunately you don't have very many choices when it
comes to handhelds with computer control these days. And for
what is available, it is only found in the top-of-the-line
models.
The only handheld you can buy new that has computer control
is the Icom IC-R10 which sells for $500+. The AOR AR8000 has
computer control but is currently not allowed for sale in the
US. You might be able to pick up one used for around $450-
$550.
You other options are to forget about the computer control
or buy a base unit that can be computer controlled. A good
option is to buy a Radio Shack Pro-2042($380) base unit and
add an Optoelectronics control board to it($200) and control
it via one of several software offerings($50-$100).
For a good, basic beginner handheld, I would recommend the
new RELM HS200(around $230). If you can afford a little more
then the Uniden BC3000XLT is a good radio($340). There are
also other considerations like what frequency coverage and
features you will want which you should educate yourself on
and will help you decide which model is right for you.
If you are interested in more info , have a look at my web
site listed below. Click on the Radio Monitoring link and
peruse the pages there. You will probably be interested in the
Getting Started pages as well as the New Scanner User FAQ
which are listed at the top of this page.
Best of luck and feel free to e-mail me if there is any-
thing else I can be of assistance with!

F O R S A L E

MARACOM M5100 VHF Marine Transceiver ----
5 and 25 watt transmit on marine frequencies.
Receives 9 NOAA weather channels, transmits
on channels 01-28 and 65-88. Digital readout.
About 7" wide, 2.25" high, 7"deep. White case
with black faceplate. Includes microphone, no
mounting hardware. Only $ 60 + shipping in US.

MOTOROLA MTX9000 fm handi-talkie radio,
model H01WCF4DB5AN NX type WCMA.
900mHz range. With charger and info.
Only $499.

PCMCIA Sound Card --- by AMP. Includes software,
cables, microphone.
V-Synth wavetable synthesizer
Wave SE sound editor
Stratos MIDI software
MIDI Tune-Up
Windows Sound System software
Cardsoft Card and Socket Services
Traveler adapter module
Microphone
Compliant with PCMCIA Release 2.1
12-bit recording and playback
5 sampling rates
Turtle Beach Hurricane architecture
Thin-profile Type II card
requires:
Type II or III PCMCIA socket
386, 486, or Pentium processor
4MB of Ram
$65 + shipping..

------------------- F L A S H L I G H T S ---------------------

4-D cell (2x2 style), krypton bulb. In box, never used.
$5 + shipping.

6-D cell multifunction lantern. Sleek tubular style with
bright incandescent light at end, 6W fluorescent bulb
along bottom, and flashing red and yellow on top. Also
has electronic sonic alarm that can be switched on with
the flashing lights. In box, never used. $12 + shipping

3-C cell Eveready worklight-style. Bright yellow with
hook for hanging, frosted bulb to diffuse light over area.
Unused, but no box. $5 + shipping

Batteries NOT included.....

COCA-COLA caps. Red cloth, white lettering. New.
$8 each + shipping. Only 9 available.

..... FOR YOUR DRIVING PLEASURE .....
1929 Mercedes SSK kitcar on VW chassis. Just completed, never titled.
Yellow, with brown fenders and running board, tan convertible top, side
curtains, and tonneau cover. Gold trim instruments.

COBRA 18-ULTRA CB ---- 40 channel, pushbutton tuning, with 3
NOAA weather channels. Includes microphone, but no mounting
hardware. $ 35.

LEXMARK/IBM PORTABLE PRINTER 5183 ---- powered by rechargable
battery or AC wall adaptor (included), this printer is only
11.5" x 3.5" x 2", and weighs about 2.5 pounds with battery
in place. Using silent thermal print head, it will print on
either thermal fax paper or on regular paper using the enclosed
thermal transfer ribbons. Very quiet in operation, and because
it runs on a battery, it is completely portable, for use with
laptop computers anywhere. Includes parallel port cable. $89.
.
ANADEX WORD-SCRIBE PRINTER ---- heavy duty dot matrix printer.
Multiple ports, but no literature so only parallel port in use
now. Tractor or friction feed. Fast, good quality; 17-inch
platten. $ 15
.
add shipping to all prices, only in US....

I can pick up cordless out to 3 miles with my Scanner Beam at 80ft.
and about 1.5 miles with a RS discone at 40 ft. Depends on where the
base unit is located in the house, the higher the better. I live in the
country, so not too much of a problem with multiple signals on the same
channel. I was amazed at the distance that I could receive cordless, so
the first thing I did was buy a digital cordless. I have the AT&T 9100
and have been very happy with it.

Hi,

> It may seem a dumb question but does ALINCO make scanners?

They manufactured the DJ-X1 some years back which, at the time competed with the likes of the R1. It was small, quite heavy but had a user interface that made the AR1000 seem easy. Overall RF performance wasn't "brilliant". It never really got a foothold here in the UK and was sooin left behind with the arrival of the Yupiteru MVT-7100 & AR8000 etc.

The new DJ-X10 has been available in Japan for a short time. Its due out in Europe in the near future and also in the States. Coverage is 0.1-2000MHz, 1200 memory channels, alpha screen, twin VFO's, bandscope, RS232 etc.

I have one here to play with and will hopefully get a chance to use it this week. There are further details on our web page.

Take Care,

> Regards,
> Tekbir

Hi,

I've been researching this for about 8 years now and the only thing that I can come up with is that these agencies do not operate on any one assigned frequency or group of assigned frequencies, but do operate "on the scene" of operation. For example, if their presence is requested in Howard County, MD then they operate on HoCo.'s frequencies. The same holds true for other jurisdictions. You could compare these agencies to the MSP's MedEvac helicopters, who operate on the assigned frequency of the jurisdiction with whom they are assisting. (Granted, the choppers fall back on aircraft freqs and SYSCOM, but you get the picture.) I do know that every morning around 7 to 7:30 am the state fire marshall "signs in" with Howard County's dispatcher on Fire-1 (154.2500), he may also do this on Carroll County's Fire-1 (33.94 or TRS) check it out! Unfortunately, I've seen those sky blue MD Dept. of Environment trucks which have emergency lights and a lot of antennae, but I've been scanning for over 10 years in this area and have never heard them on the air, go figure.

I hope this helps...

Andy

5351. FS: Scanner - $50

Hi there! I have a Realisitic PRO-42 (Radio Shack) handheld scanner for sale. I'm asking $50 for this baby (I paid $80 for it on clearance 2.5 years ago). It's in mint condition. I may have used it 10-15 times. It's just collecting dust, and I need the cash to buy an HT-202. It has a few minor scratches in the front (you can hardly notice them). Just being honest. I used to place it "face-down" on the shelf. Other than that it is perfect!!! I bought this with the intent to use it with a RAMSEY Cellular kit. Their kit costs about $50, and it lets you listen in on cellular conversations. For more information take a look at http://www.ramseyelectronics.com/prod05.htm

Specifications: I don't have the box, or instructions, but it is SIMPLE to use! It is 10-channel programmable. It has a phone-type keypad, which allows you to "plug in" the frequency you want. It has a FULL frequency LCD display, and built-in light. Frequency coverage: 30MHz-54Mhz, 138Mhz-174Mhz, and 380MHz-512MHz. Again, you may add a kit like the RAMSEY-KIT and be able to receive cellular.

Sorry if this is a long message, but some people might be interested in this info. I estimate that S&H costs will be an additional $7.50, but I'm not sure. I live in Philadelphia, PA. Thanks for your interst!
George

I have for sale an Icom 735 for $545.00 plus the shipping.

It is in good working condition and has the box & manual. I purchased the radio in 1992, and I am the second owner, so I am not exactly sure on the age,but believe it is 8 to 9 years old. It is just the standard radio, no added extras like filters. I am willing to meet up with someone on the air if they would like to hear the radio.

For more info you can e-mail me at:

t95194@aol.com

Please send inquires to my e-mail address instead of posting them here, since I am not sure when I will return again.

73's & Thanks

Dave (N9NMD)

Why haven't you responded to the 3 blatant advertisements posted since the Cheek post but before yours? Oh we know why don't we?

> In the spirit of the free exchange of info, and in spite of the fact that
> I'm responding to an 'illegal' commercial posting, I am offering up my
> opinion of this publication: It stinks.

You forgot to add that this opinion is from a newbie that last year was posting on the ham radio group asking if he could safely hook a TV antenna to a scanner. To further prove your lack of knowledge in this hobby you then say;

> It is merely a re-hashing of info on the only scanners Mr. Cheeks knows
> anything about, namely the Radio Shack 2xxx series. As everyone knows,
> these are units that are no longer competing in the Scanner Olympics.

Who is your "everyone" that knows, Peter? The RS 2xxx series is still one of the better radios new or used. Have you not noticed how fast the 2xxx series sells when offered up? Are you really that blinded by you hate and illness? You have to be, nobody would make such a stupid statement if they weren't. Regardless of your opinion of Mr. Cheek, the 2xxx will have a place in many seasoned scannerists shack for many years to come. That IS a fact.

If you really feel the 2xxx series is so poor than state those characteristics that formed your opinion. Was it the triple conversion? Wide frequency coverage? Easy to modify? Ability to add computer control by two different companies? So what is the problem with the 2xxx series. You have made a serious statement about this radio, please back it up. Why do you consider it no good? Please show us all the depth of your knowledge and lets discuss the RS2xxx series. Back up your statement Peter.

> Unless you're interested in possibly modifying an old 2006 to double as a
> telephone answering machine, you'll be better off with PopComm or
> Monitoring Times.

PopComm? Well you have shown it all Peter. Opinions are one thing but yours seems to try and come off as fact. The problem is your facts are fantasy and show your ignorance. Then again we know your post had nothing to do with scanners, facts or any of that did it? If you want to discuss real merits of scanners then fine, do so. For you it would be a first. If you want to be the advertising net cop then send Big Mikey a note and join up.

If you want to piss on Cheek than take it to alt.flame.cheek.pjb.sic.

This is probably off-topic to the scanner group, but your story reminds me of something that happened when I was covering cops in Cape Giraradeau, Mo., years ago.

The police report read (and I remember it years later):

"While on routine patrol of Cherry Hill, I noticed a large group surrounding a parked car. Upon investigation, I observed a couple engaged in sexual intercourse. When they completed the activity in which they were muchly engaged, I wrote them a citation for disturbing the peace."

>
>Anyone sell one of these lately? I'd like to hear from you.
>
>Thanks,
>Rick

Hello,

Well so far it's two for the asking price and two against. If it weren't
for this newsgroup I'd probably sell it for half, maybe even less, of what
I paid new even with the extras. I have seen asking prices approaching
$200.00 on the 'Net so I thought $175 might be fair.

Frankly, though, I'm not sure I want to get rid of it. My wife doesn't
understand the need for more than one handheld when I've got a base plus
my two amateur band handhelds make acceptable wideband receivers too.
But to keep peace in the house I may sell it. (Bet she wouldn't want to
get rid of one of our two cats or one of our extra televisions?)

Thanks for the responses,
Rick

Roger D. Cravens, Jr. (ke4yqz@mindspring.com) hath said:
: #-> THE 69TH ANNUAL ATLANTA RADIO CLUB'S HAMFESTIVAL
: #-> Hope to see you at the hamfest soon.
: #-> Richard Dean Young KR4IU
: #-> rychard@atl.mindspring.com
: 73's and hope everyone enjoys their stay here in Hot-Lanta!!
: KE4YQZ

HOT is right... I was there, Just got back in Mississippi from Atlanta lastnight, and it feels good to be home again. If you have anything to do with the festival staff, please pass a suggestion to them, either do the hamfest in a different part of the year, or find something better than that old sears building. The heat inside there was bad, there was not enough fans running to keep the place cool, the junk side of it had it better. Also, where the concession area was didn't have enough seats for people to take a break. I drove 5 hours to come to this hamfest and to be honest was not impressed. First thing bad that happened (not the fault of the ARC) but of the area was that all of the hotels were booked up.
Second, whoever did TALK-IN on 146.82 needs to be releived of his duty because he couldn't give simple directions from the Lenex Sq Center on Peachtree to the convention. We spent 20 minutes looking all over for the place, finally found it, and all of the parking was full! Not to mention, how in the world did people with disablilites get there??? I mean we had to walk almost 1/4 a mile just to get there from parking.
While on the note of talk-in's and operating practice, I pity you all in the Atlanta area, having to put up with the crap that people do on there all the morning long it seemed like someone was jamming 146.82 whenever someone tried to give directions, or playing with the functions from their keypad, such childish stuff doesn't happen where I'm at, and I'm happy that people here in South Mississippi don't do stupid stuff like that, and about 4am on 146.82 I called for asst. and got some MORON on the radio I sure wish I knew his callsign now so I could tell everyone, but I asked if he could place a call for us to a hotel and check why they wouldn't come to the doors (it was locked) and this guy just rambled on and on about not knowing anything about a hotel being locked up and not knowing about any of the hotels affiliated with the fest (I was refering to the Holiday Inn Select) Which is on the list of hamfest rated hotels. It took this guy 5 minutes to attempt to answer a simple question of YES or NO... We would drive around listening to this MORON ramble on about stupid stuff when we were asking him for help/direct asst. Someone needs to keep all of the mental cases off of the repeaters.

> Does this phone support Caller ID?

Do you think a long distance company like AT&T (Lucent? don't kid yourself)
would want to support the caller ID revenue of a local phone company?

Nope, no caller ID. Otherwise its a good cordless but expensive (better to
support their own revenue pockets).

5374. PRO-43 freq problem

Newsgroup: rec.radio.scanner
Date: 1997-06-23 00:00:00 UTC
From: Justin England <jengland@hills.net>
Message-ID: <33AF182F.167EB0E7@hills.net>
Source record: 193623

I have two scanners, an old pro-38 and a pro-43. The local police have several cannels in the 453.xxxx range which I can pick up just fine using my pro-38. When I enter the freqs in my pro-43, I hear nothing. Doing a search in that range, I found that I can pick up the different freqs if I add .0125 to the main frequency. For instance, the dispatch is 453.9000, which I can hear just fine on the pro-38, but on the pro-43 I have to use 453.9125. I have verified each channel the police use on the two different scanners, and adding .0125 always works. Any other agency that I listen to (on different bands) I can hear using the "normal" frequency.

The question is whether my scanner is going bad, is this an oddity of the pro-43, or is this an oddity of my pro-43 specifically??
Or if anybody could explain to me why this is happening??

Thanks,

Justin England -- jengland@enetis.net

For Sale

Diamond D130J Discone. Only Two months old. Like new condition. With Manual.
$55.00 Firm

The discone antenna is used by government and military agencies worldwide because of its wide bandwidth characteristics and non-directional coverage. Designed for use with wide-frequency coverage VHF/UHF scanners and receivers, the Diamond D130J discone consists of 16 rugged, stainless steel elements and is capable of transmitting up to 200 watts in the amateur 50, 144, 220, 432, 900, and 1200 MHz bands. As a receiving antenna, the D130J is omni-directional for continuous 25-1000 MHz (and above) coverage. A base-loaded, vertical top element is used as a low band (30-50 MHz) frequency extender. The elements are arranged on a 24-inch support pipe equipped with two strong mounting brackets to accomodate any standard mast-pipe (1"to 2-1/8" diameter).

Forget for a moment that Cheek's original post was a self-serving, bombastic advertisement that he could probably not afford to pay for if this group were a commercial publication. The WSR, and Cheek's publications in general, are the most credible and well-written sources of info around.

> It is merely a re-hashing of info on the only scanners Mr. Cheeks > knows anything about, namely the Radio Shack 2xxx series.

So what? Have you ever heard of "supply and demand"? Cheek isn't still writing about the PRO2xxx series several years after they went out of production just for the hell of it. There are millions of these scanners in circulation.

> Unless you're interested in possibly modifying an old 2006 to double as a > telephone answering machine, you'll be better off with PopComm or
> Monitoring Times.

OPEN INVITATION TO ANYONE READING THIS: If you have a PRO2006 and the best thing you can think of is to turn it into an answering machine, kindly send it to me, postage due, and I will send you back, postage paid, any make and model of answering machine you choose, brand new in the box.

If you don't like the guy personally, that's fine. He's not asking for your hand in marriage. But don't take away the credit he deserves for his technical knowledge.

Peace,
Charlie

Here is a trick.
From grove you can buy a nifty little device that you hook up to the ear phone plug in on the scanner and then it transmits (in low power) to a radio frequency of your choice. You could shove the scanner under your seat, and since it is wireless it would transmit to your stereo. Also grove has a device that you hook up to your antenna jack and it turns your entire car into an antenna. If a cop pulls you over so what, he won't care if you change the radio station :)

Well, the best handheld (from what I heard) is the AR-8000, however I have a BC-3000, and I love it. You might want to check into the new "trunk trackers". Also the AR-8000 is easily modifiable for cellular but the FCC has made it "illegal to sell" because of it's easy modifications.

Again, I work at McDonalds, we have 3 sets of frequencies. One is called the "A" chanel, this goes from the headsets to the drive thru speakers. The other is called the "B" channel. This is for employee to employee. We use this to inform the other about orders or to make fun of the customers. The last one comes from our transmitter to the headsets and transmits both sides of the conversation. If you picked up only the "A" or "B" freq. You would only here one side of the conversation. Hope I helped. Check out
http://www.geocities.com/siliconvalley/lakes/1962
for those freqs.

Victory doesn't cool anger

By Angela Cortez
Denver Post Staff Writer

June 7 - Carole Ward, who won a $325,000 judgment against the Internal Revenue Service in a Denver federal court this week, had more - much more - to say against the federal government Friday.

"Based on my 15 minutes of fame, I would've expected a greater loss of life and property of the federal government by now," Ward said to shocked hosts on KOA's morning radio talk program Friday. "There is a conspicuous absence of violence against the government."

Ward's family business was raided by armed IRS agents in 1993, four weeks after she insulted an agent, telling her: "Honey, from what I can see of your accounting skills the country would be better served if you were dishing up chicken-fried steak on some interstate in West Texas, with all the clunky jewelry and big hair."

Revenue agents padlocked all three Kids Avenue clothing stores in Colorado Springs, and posted notices that some customers interpreted as evidence that Ward was a drug smuggler.

She was still seething Friday, telling the talk show audience that while she was not about to grab a weapon, she could see why some people would make bombs or take up arms against the government.

"What about the high-risk group, which is young white males without college that don't have the communication skills I do?" Ward said. "They might be saying, 'I'm going to get a gun. I'm going to make a bomb,' " she said.

KOA talk show hosts, taken aback, implied Ward was making a tough statement given the Oklahoma City bombing trial of recent weeks.

"I don't know if it's a tough thing to bring up at all," she responded. "It's a natural consequence of abuse by government. But the fact is it's the only response. When I see what I went through ... I knew how to gain support. I knew how to get the word out. What about the ones at risk, (they) are the ones you're going to have trouble with."

Later from her home in Albuquerque, where she moved recently, Ward did not back down from her comments. She said she was trying to make the point that she was able to win her case against a government agency - to right a wrong - because her background is clean, she is educated

and she is a strong communicator. But for others, the frustration may get the best of them and, ultimately, innocent victims.

Ward, who once ran a newspaper in Telluride, said she has always been outspoken. "I'm a child of the '60s," she explained. "I'm a pain in the ass, but I'm no right-wing militia member. I'm just a housewife with not enough to do."

Ward, 49, was awarded $325,000 in punitive damages and attorney's fees Monday after her family businesses and property were raided by the IRS. Her 80-year-old mother was residing at one of the properties.

A federal judge in Denver said the actions by the IRS agents violated Ward's privacy rights. The IRS has denied any wrongdoing.

Ward said that her experience has made her aware of a subculture of anti-government people who she believes would take up arms against the government. While she said she would not, she believes that if what happened to her happens to others less stable, the country should not be surprised if some people "do stupid things."

"This is not paranoia. I've lived this, but I made it through," she said. "I have dreams of taking a machine gun to a room of people. I could never do that, but if I feel like that, could you imagine what someone else might do?''

You guys might laugh now, but Pizza Hut just announced that they are
beginning to hire Psychics for delivery ppl. My local one just hired
three new drivers and tonight just as my wife had picked up the
telephone, there was a ring of the doorbell. The pizza was exactly the
same as what my wife and I had decided on and the driver even told us
that we could use the coupon that was on the front of our refrigerator. I
was just shocked and went to grab my checkbook and the driver told me
that I had used my last check at Wal-Mart Saturday morning and that the
$20 bill in my wallet would cover the pizza and tip quite readily.

THE WORLD SCANNER REPORT

The "WORLD SCANNER REPORT" is a hard-hitting, tell-it-like-it-is, no-holds-barred, kick-ass, take-names irreverent newsletter that started in January, 1991. The "WSR" runs 8 to 10 pages, per month, ten times a year, in a high quality 600-dpi laser printed format, complete with photos, graphics, tables, and charts. It's filled with hot, rare, juicy, inside stuff about VHF-UHF scanner technology, engineering & operation! If you like sizzle with your steak, there is nothing like it! It's high tech talk translated to layman's lingo!

The "WORLD SCANNER REPORT" is published and edited by Bill Cheek, the author of the ULTIMATE SCANNER and the two SCANNER MODIFICATION HANDBOOKs. You may already own or have heard about these best-selling, do-it-yourself manuals on scanner mods, alterations, trick-outs and soup-ups. One mission of the "WSR" is to supplement, reinforce and update the material in my books and to take up where my books leave off.

OBJECTIVES OF THE WSR

(1) To Promote And Encourage Growth of the Scanning Hobby
(2) To Incorporate the latest technology into scanners
(3) To disseminate the latest technical knowledge & info about scanners
(4) To enhance the accuracy, efficiency, and timeliness of radio communications
(5) To stimulate the pleasure & benefits of hobby radio.

The predominant share of "WSR's" material is about scanners and scanning. Some attention may be given to Citizens Band, Amateur, Shortwave, computers, and other areas, but scanners & scanning are what we're all about here. We take our radioing very seriously, at a world class level, so to speak.

CONTENTS OF THE WSR

The "WSR" covers scanner technology & engineering, but not in overly sophisticated technical lingo! We talk a common everyday jargon that's within the grip of most radio hobbyists. You do not have to be an engineer or a tech to appreciate the "WSR". Some material comes from engineers, technicians and serious hobbyists, but I edit, translate and present that stuff in a form and on a level that can be handled by most non-technical folks.

The SCANNER MODIFICATION HANDBOOKs are legendary examples of my ability to transfer technology to grass-roots people. Shortly after Vol-1 of the SMH was published, a fellow told me that he possessed only an 8th-grade education and that he was able to successfully perform all the modifications to his PRO-2004. The "WSR" follows in that tradition!

The "WSR" offers guidelines, procedures and methods to extract the ultimate in performance from VHF-UHF scanner receivers. We focus on the better scanners, not only because I know them inside and out, but also because these form a major chunk of the current scanner market. We are not limited to the "best sellers", however. Others get attention, too.

The "WSR" gets into hacking and modifying scanners, but it also digs into theory; operation; troubleshooting, problem diagnosis, alignment and maintenance of scanner radios. (If you're going to rip into yours, you might as well know something about its circuitry and what makes it tick, right?) We explore all areas of scanning, scanners and technology that can benefit the scannist. So what turns you on? Would conversion of a 400-channel scanner into one with 6,400 channels do it? Not enough? Ok, will 25,600 channels do? More? How about LED and analog S-meters? Cellular hacks for older scanners? Sure....

Maybe a circuit to automatically LOCKOUT active channels while doing nothing to inactive ones? Sure, leave things unattended for a while and when you return, any frequency that was active will be locked out. How about a simple circuit to make your scanner auto-resume SCAN or SEARCH after it locks upon a data channel? Does your scanner go too slow? We'll speed it up. Is your DELAY function too short? Let's lengthen it. How about a CTCSS Tone Decoder for your scanner, and while you're at it, a ToneFinder? How about interfacing your scanner to a computer? The "WSR" explores these and much more, including automatic tape recorder switches, center tuning meters and even antennas! The sky's our limit and when we reach it, we set new limits and break them, too!

The "WSR" focuses on the hardware of scanning and max performance. This includes microscopic attention on the innards of scanner receivers and on the stuff that bolts on or hooks up to 'em including: antennas, coax cables, connectors, preamps, converters, computers & computer interfaces, grounding systems and power supplies.

The "WSR" daringly exploits other off-areas of scanning including surveillance and electronic countermeasures, signal detectors, frequency counters, volt/ohm meters and other types of electronic test equipment. We even mess with computers a little (not enough to scare you, though!) The "WSR" can help you acquire, assemble, fine-tune, maintain and operate a high performance monitoring station!

Authors, Columnists and Reader questions invited! Monthly columnists eligible for FREE subscriptions & other perks. If you want to build your writing credentials, an opportunity may exist for you at the

"WSR". Come on board for a Life Adventure!

Somebody's out there, somebody's waiting
Somebody's trying to tell me something

from 'Somebody's Trying to Tell Me Something', on 10, 9, 8, 7, 6, 5, 4, 3, 2, 1 by Midnight Oil

Monday, 16 October 1989
Kennedy Space Center, Florida

NASA buzzed with the excitement of a launch. Galileo was finally going to Jupiter.

Administrators and scientists in the world's most prestigious space agency had spent years trying to get the unmanned probe into space. Now, on Tuesday, 17 October, if all went well, the five astronauts in the Atlantis space shuttle would blast off from the Kennedy Space Center at Cape Canaveral, Florida, with Galileo in tow. On the team's fifth orbit, as the shuttle floated 295 kilometres above the Gulf of Mexico, the crew would liberate the three-tonne space probe.

An hour later, as Galileo skated safely away from the shuttle, the probe's 32500 pound booster system would fire up and NASA staff would watch this exquisite piece of human ingenuity embark on a six-year mission to the largest planet in the solar system. Galileo would take a necessarily circuitous route, flying by Venus once and Earth twice in a gravitational slingshot effort to get up enough momentum to reach Jupiter.

NASA's finest minds had wrestled for years with the problem of exactly how to get the probe across the solar system. Solar power was one option. But if Jupiter was a long way from Earth, it was even further from the Sun - 778.3 million kilometres to be exact. Galileo would need ridiculously large solar panels to generate enough power for its instruments at such a distance from the Sun. In the end, NASA's engineers decided on a tried if not true earthly energy source: nuclear power.

Nuclear power was perfect for space, a giant void free of human life which could play host to a bit of radioactive plutonium 238 dioxide. The plutonium was compact for the amount of energy it gave off - and it lasted a long time. It seemed logical enough. Pop just under 24 kilograms of plutonium in a lead box, let it heat up through its own decay, generate electricity for the probe's instruments, and presto! Galileo would be on its way to investigate Jupiter.

American anti-nuclear activists didn't quite see it that way. They figured what goes up might come down ..NASA assured them Galileo's power pack was quite safe. The agency spent about $50 million on tests which supposedly proved the probe's generators were very safe. They would survive intact in the face of any number of terrible explosions, mishaps and accidents. NASA told journalists that the odds of a plutonium release due to 'inadvertent atmospheric re-entry' were 1 in 2 million. The likelihood of a plutonium radiation leak as a result of a launch disaster was a reassuring 1 in 2700.

NASA's Goddard Space Flight Center, Greenbelt, Maryland

Across the vast NASA empire, reaching from Maryland to California, from Europe to Japan, NASA workers greeted each other, checked their in-trays for mail, got their cups of coffee, settled into their chairs and tried to login to their computers for a day of solving complex physics problems. But many of the computer systems were behaving very strangely.

>From the moment staff logged in, it was clear that someone - or something - had taken over. Instead of the usual system's official identification banner, they were startled to find the following message staring them in the face:

```
W O R M S A G A I N S T N U C L E A R K I L L E R S

```

You talk of times of peace for all, and then prepare for war.

This was not going to be a good day for the guys down at the NASA SPAN computer network office.
This was not going to be a good day for John McMahon.

--

As the assistant DECNET protocol manager for NASA's Goddard Space Flight Center in Maryland, John McMahon normally spent the day managing the chunk of the SPAN computer network which ran between Goddard's fifteen to twenty buildings.

McMahon worked for Code 630.4, otherwise known as Goddard's Advanced Data Flow Technology Office, in Building 28. Goddard scientists would call him up for help with their computers. Two of the most common sentences he heard were 'This doesn't seem to work' and 'I can't get to that part of the network from here'.

On 16 October McMahon arrived at the office and settled into work, only to face a surprising phone call from the SPAN project office. Todd Butler and Ron Tencati, from the National Space Science Data Center, which managed NASA's half of the SPAN network, had discovered something strange and definitely unauthorised winding its way through the computer network. It looked like a computer worm.

A computer worm is a little like a computer virus. It invades computer systems, interfering with their normal functions. It travels along any available compatible computer network and stops to knock at the door of systems attached to that network. If there is a hole in the security of the computer system, it will crawl through and enter the system. When it does this, it might have instructions to do any number of things, from sending computer users a message to trying to take over the system. What makes a worm different from other computer programs, such as viruses, is that it is self-propagating. It propels itself forward, wiggles into a new system and propagates itself at the new site. Unlike a virus, a worm doesn't latch onto a data file or a program. It is autonomous.

At the SPAN centre, things were becoming hectic. The worm was spreading through more and more systems and the phones were beginning to ring every few minutes. NASA computers were getting hit all over the place.

The SPAN project staff needed more arms. They were simultaneously trying to calm callers and concentrate on developing an analysis of the alien program. Was the thing a practical joke or a time bomb just waiting to go off? Who was behind this?

NASA was working in an information void when it came to WANK. Some staff knew of the protesters' action down at the Space Center, but nothing could have prepared them for this. NASA officials were confident enough about a link between the protests against Galileo and the attack on NASA's computers to speculate publicly that the two were related. It seemed a reasonable likelihood, but there were still plenty of unanswered questions.

Callers coming into the SPAN office were worried. People at the other end of the phone were scared. Many of the calls came from network managers who took care of a piece of SPAN at a specific NASA site, such as the Marshall Space Flight Center. Some were panicking; others spoke in a sort of monotone, flattened by a morning of calls from 25 different hysterical system administrators. A manager could lose his job over something like this.

Most of the callers to the SPAN head office were starved for information. How did this rogue worm get into their computers? Was it malicious? Would it destroy all the scientific data it came into contact with? What could be done to kill it?

NASA stored a great deal of valuable information on its SPAN computers. None of it was supposed to be classified, but the data on those computers is extremely valuable. Millions of man-hours go into gathering and analysing it. So the crisis team which had formed in the NASA SPAN project office, was alarmed when reports of massive data destruction starting coming in. People were phoning to say that the worm was erasing files.

It was every computer manager's worst nightmare, and it looked as though the crisis team's darkest fears were about to be confirmed.

Yet the worm was behaving inconsistently. On some computers it would only send anonymous messages, some of them funny, some bizarre and a few quite rude or obscene. No sooner would a user login than a message would flash across his or her screen:

Remember, even if you win the rat race-you're still a rat.

Or perhaps they were graced with some bad humour:

Nothing is faster than the speed of light...
To prove this to yourself, try opening the refrigerator
door before the light comes on.

Other users were treated to anti-authoritarian observations of the paranoid:

The FBI is watching YOU.

or

Vote anarchist.

But the worm did not appear to be erasing files on these systems. Perhaps the seemingly random file-erasing trick was a portent of things to come - just a small taste of what might happen at a particular time, such as midnight. Perhaps an unusual keystroke by an unwitting computer user on those systems which seemed only mildly affected could trigger something in the worm. One keystroke might begin an irreversible chain of commands to erase everything on that system.

The NASA SPAN computer team were in a race with the worm. Each minute they spent trying to figure out what it did, the worm was pushing forward, ever deeper into NASA's computer network. Every hour NASA spent developing a cure, the worm spent searching, probing, breaking and entering. A day's delay in getting the cure out to all the systems could mean dozens of new worm invasions doing God knows what in vulnerable computers. The SPAN team had to dissect this thing completely, and they had to do it fast.

Some computer network managers were badly shaken. The SPAN office received a call from NASA's Jet Propulsion Laboratories in California, an important NASA centre with 6500 employees and close ties to California Institute of

Technology (Caltech).

JPL was pulling itself off the network.

This worm was too much of a risk. The only safe option was to isolate their computers. There would be no SPAN DEC-based communications with the rest of NASA until the crisis was under control. This made things harder for the SPAN team; getting a worm exterminating program out to JPL, like other sites which had cut their connection to SPAN, was going to be that much tougher. Everything had to be done over the phone.

Worse, JPL was one of five routing centres for NASA's SPAN computer network. It was like the centre of a wheel, with a dozen spokes branching off - each leading to another SPAN site. All these places, known as tailsites, depended on the lab site for their connections into SPAN. When JPL pulled itself off the network, the tailsites went down too.

It was a serious problem for the people in the SPAN office back in Virginia. To Ron Tencati, head of security for NASA SPAN, taking a routing centre off-line was a major issue. But his hands were tied. The SPAN office exercised central authority over the wide area network, but it couldn't dictate how individual field centres dealt with the worm. That was each centre's own decision. The SPAN team could only give them advice and rush to develop a way to poison the worm.

Next or Previous

The SPAN office called John McMahon again, this time with a more urgent request. Would he come over to help handle the crisis?

The SPAN centre was only 800 metres away from McMahon's office. His boss, Jerome Bennett, the DECNET protocol manager, gave the nod. McMahon would be on loan until the crisis was under control.

When he got to Building 26, home of the NASA SPAN project office, McMahon became part of a core NASA crisis team .. At first the core team seemed only to include NASA people and to be largely based at Goddard. But as the day wore on, new people from other parts of the US government would join the team.

The worm had spread outside NASA.

It had also attacked the US Department of Energy's worldwide High-Energy Physics' Network of computers. Known as HEPNET, it was another piece of the overall SPAN network, along with Euro-HEPNET and Euro-SPAN. The NASA and DOE computer networks of DEC computers crisscrossed at a number of places. A research laboratory might, for example, need to have access to computers from both HEPNET and NASA SPAN. For convenience, the lab might just connect the two networks. The effect as far as the worm was concerned was that NASA's SPAN and DOE's HEPNET were in fact just one giant computer network, all of which the worm could invade.

The Department of Energy keeps classified information on its computers. Very classified information. There are two groups in DOE: the people who do

research on civilian energy projects and the people who make atomic bombs. So DOE takes security seriously, as in 'threat to national security' seriously. Although HEPNET wasn't meant to be carrying any classified information across its wires, DOE responded with military efficiency when its computer managers discovered the invader. They grabbed the one guy who knew a lot about computer security on VMS systems and put him on the case: Kevin Oberman.

Even as the WANK worm coursed through NASA, it was launching an aggressive attack on DOE's Fermi National Accelerator Laboratory, near Chicago. It had broken into a number of computer systems there and the Fermilab people were not happy. They called in CIAC, who contacted Oberman with an early morning phone call on 16 October. They wanted him to analyse the WANK worm. They wanted to know how dangerous it was. Most of all, they wanted to know what to do about it.

The DOE people traced their first contact with the worm back to 14 October. Further, they hypothesised, the worm had actually been launched the day before, on Friday the 13th. Such an inauspicious day would, in Oberman's opinion, have been in keeping with the type of humour exhibited by the creator or creators of the worm.

Oberman began his own analysis of the worm, oblivious to the fact that 3200 kilometres away, on the other side of the continent, his colleague and acquaintance John McMahon was doing exactly the same thing. ..

John McMahon's analysis suggested there were three versions of the WANK worm. These versions, isolated from worm samples collected from the network, were very similar, but each contained a few subtle differences. In McMahon's view, these differences could not be explained by the way the worm recreated itself at each site in order to spread. But why would the creator of the worm release different versions? Why not just write one version properly and fire it off? The worm wasn't just one incoming missile; it was a frenzied attack. It was coming from all directions, at all sorts of different levels within NASA's computers.

McMahon guessed that the worm's designer had released the different versions at slightly different times. Maybe the creator released the worm, and then discovered a bug. He fiddled with the worm a bit to correct the problem and then released it again. Maybe he didn't like the way he had fixed the bug the first time, so he changed it a little more and released it a third time.

In northern California, Kevin Oberman came to a different conclusion. He believed there was in fact only one real version of the worm spiralling through HEPNET and SPAN. The small variations in the different copies he dissected seemed to stem from the worm's ability to learn and change as it moved from computer to computer.

The worm circumnavigated the globe. It had reach into European sites, such as CERN - formerly known as the European Centre for Nuclear Research - in Switzerland, through to Goddard's computers in Maryland, on to Fermilab in

Chicago and propelled itself across the Pacific into the Riken Accelerator Facility in Japan.

NASA officials told the media they believed the worm had been launched about 4.30 a.m. on Monday, 16 October.

They also believed it had originated in Europe, possibly in France ..

The WANK worm left a number of unanswered questions in its wake, a number of loose ends which still puzzle John McMahon. Was the hacker behind the worm really protesting against NASA's launch of the plutonium-powered Galileo space probe? Did the use of the word 'WANK' - a most un-American word - mean the hacker wasn't American? Why had the creator recreated the worm and released it a second time? Why had no-one, no political or other group, claimed responsibility for the WANK worm?

One of the many details which remained an enigma was contained in the version of the worm used in the second attack. The worm's creator had replaced the original process name, NETW_, with a new one, presumably to thwart the anti-WANK program. McMahon figured the original process name stood for 'netwank' - a reasonable guess at the hacker's intended meaning. The new process name, however, left everyone on the SPAN team scratching their heads: it didn't seem to stand for anything. The letters formed an unlikely set of initials for someone's name. No-one recognised it as an acronym for a saying or an organisation. And it certainly wasn't a proper word in the English language. It was a complete mystery why the creator of the WANK worm, the hacker who launched an invasion into hundreds of NASA and DOE computers, should choose this weird word. The word was 'OILZ'.

It is not surprising the SPAN security team would miss the mark. It is not surprising, for example, that these officials should to this day be pronouncing the 'Oilz' version of the WANK worm as 'oil zee' .. nor that they hypothesised the worm's creator chose the word 'Oilz' because the modifications made to the last version made it slippery, perhaps even oily.

Likely as not, only an Australian would see the worm's link to the lyrics of Midnight Oil.

This was the world's first worm with a political message, and the second major worm in the history of the worldwide computer networks...

Yet, NASA and the US Department of Energy were half a world away from finding the creator of the WANK worm. Even as investigators sniffed around electronic trails leading to France, it appears the perpetrator was hiding behind his computer and modem in Australia ...

I have read many books, magazines, and numerous articles

about scanner frequencies along with watching the postings in various

newsgroups. Why is it that whenever you see a frequency such as a

public service, hotel taxi service, tow truck company etc.. you never

see what the input frequency is or what the PL (ctcss) tone is?

(assuming they are using a repeater). I live in the Atlanta Ga,

area. Is there online resource with this information? I do not plan

to tranmit on any unauthorized frequencies. I am just curious.

Thanks for any comments.

You normally don't see the input freqs listed because they are not needed for scanning. If the user is on a rptr, listening to the output allows you to hear all users, not just those in your immediate vicinity, which is all you will hear on the input (although, for tracking purposes, that would be desirable).

Sub-audible tones have not been posted until recently, as the older scanners were not equipped to decode them. Now, however, with newer scanners being tone-capable, with more services utilizing sub-audible tones than before, and with many hams using their CTCSS-equipped ham rigs for non-ham receive, you will find that the CTCSS or DCS tones will be listed with the freqs.

As well, many "lists" are just copies of the FCC database, which does not list tones (they are not needed for frequency allocation), and unless the editors or publishers of the lists actually go out and verify the freqs, they will never know the tones.

> can pick up all kinds of fascinating and exciting frequencies?

George,
The services most listened to, and those that draw most people to scanning are police, fire and EMS agencies. Another favorite are the commercial and military aeronautical bands. Take a look at the following web page for more agencies that use radio

http://www.qsl.net/n2mca/SERVICES.HTM

Exactly what you will be able to hear is dependent on where you live and what agencies are in your area. You live in a pretty dense region so expect to hear more radio traffic than you can possibly imagine.
Since you are also new to the hobby, I would suggest taking a look at

http://www.qsl.net/n2mca/STARTING.HTM
http://www.qsl.net/n2mca/NEW_USER.HTM

for some introductory info.
As for buying a scanner, there are many, many models to choose from; espcially when you consider older, used models. You will have to decide on how much you are going to spend and whether you want a base, mobile(car) or handheld unit. You will also need to decide what frequency coverage you want in the radio you are going to purchase. Typically, the more frequencies a radio can receive, the more it costs. Since you live in a suburban/urban area, you will probably want a triple-conversion(as oppossed to double-conversion) receiver to cut down on various forms of radio interference which are prevalent in larger communities due to locally strong TV, FM, cellular and paging signals.
So have a look at the above mentioned pages and anything else that may be lying around my radio web pages, educate yourself on what you think you'll need and give me an e-mail if you have

further questions! Good luck!

Strong signals,

From: chiefjim@unix.nospam.asb.com
Message-ID: <EC8CJM.DE5@nonexistent.com>
Source record: 193688

Wound up buying the Pro-60 Friday evening which was just in time for two air shows.

Two problems arose which hindered my evaluation. First is likely a manufacturing flaw. The battery pack makes intermittent contact when loaded. So even with fresh batteries there are times the display goes blank. Time wasted changing batteries only to discover the actual nature of the problem was frustraiting.

The other is more my over expectations. I had entered 10 local frequencies to scan. Very often I received clipped messages as the scanner locked in mid way thru a short transmission.

Related to this was the inability to identify air show discreet. Even with knowing the band range to expect the frequency was never identified.

On the bright side was listening to the Blue Angels. From the calls it became rather easy to follow the various flights around the field. But I must give them credit for they apparently know some are listening in. One of the solos remained silent long enough to sneak up behind the crowd.

Now to exchange this receiver for another and try again next weekend.

After a great visit to the Atlanta Hamfest (and drooling over a stack of TrunkTrackers for $285 cash), I bought and built a $40 Ramsey SS-70 Speech Scrambler/Descrambler to use with my PRS-101 handhelds. Since I only bought one, I had to check it out on something so I checked a neighboring Police Dept that uses voice inversion on UHF. My soldering must've been good cuz it worked! Then I heard the familiar "Donald Duck" sound on 46.61 MHz so I thought I'd try it there too. The force was strong with Young Skywalker but not strong enough, it worked there too. Love this little scanner accessory. Everyone should try one.

Just a reminder that the next Trunk Tracker discussion will be held on
Monday June 23 @ 7:00pm PST.

Who's invited? Anyone interested in radio monitoring especially
trunked radio systems with the new Uniden Trunk Tracker.

Where will the meeting be held? There are two ways to join the
meeting, the easy way (for people not familiar with IRC) is to point
your web browser towards: www.wolfenet.com/~daydream
and click on chat room.
You can also connect using your favorite IRC client (Mirc, etc.).
Server: webmaster.ca.us.webchat.org Channel name: #Intercept

If you are in need of a IRC client, Mirc can be found @:
http://www.createch.net/mirc/

We look forward to seeing everyone at the meeting..

INTERCEPT

Are you using a "Built in" antenna on the scanners if so you won;t
get around the interference but an External antenna hanging on my
ceiling and some RG-8U Coax solved my problems with my Pro-2006 except
for some of the Marine Band 156.0-157.0
specifically. Sorry don't know if this would help the handhelds you
mention but it should help the 2006.

Please explain why guys in this newsgoup seem to go out of their
way to not believe the actions of 'Jack Booted Thugs' and yet they
seem to go to great lengths to have to avoid the issue of local
Jack Booted Thugs taking away their precious scanners.

It would seem that if local JBT's get so worked up over something as
piddly as a hobbyist having a scanner, don't you think there might be
some truth to what the 'paranoid lawbreakers' are saying about JBT's
getting out of hand busting down doors, and seizing homes cause 'junior'
just happens to have an ounce of weed in his pants pocket. Or pointing
automatic weapons with laser sights at 80 yr old senior citizens jerked
out of bed and slammed face down on the concrete at 2 am in the morning.

If a local JBT can impound your car and detain you for hours just
cause he doesn't like you having a scanner in your car... just think
how a JBT with a bad attitude can ruin your day. (especially if they
swore out a misleading or false search warrant).

It just seems hypocritical for the 'support your local law enforcement'
types to be so against those who complain about JBT's not being held
accountable for their crimes. They just happen to be the most vocal ones
complaining about local scanner laws and overzealous cops enforcing
those laws.

F O R S A L E

MARACOM M5100 VHF Marine Transceiver ----
5 and 25 watt transmit on marine frequencies.
Receives 9 NOAA weather channels, transmits
on channels 01-28 and 65-88. Digital readout.
About 7" wide, 2.25" high, 7"deep. White case
with black faceplate. Includes microphone, no
mounting hardware. Only $ 60 + shipping in US.

MOTOROLA MTX9000 fm handi-talkie radio,
model H01WCF4DB5AN NX type WCMA.
900mHz range. With charger and info.
Only $499.

PCMCIA Sound Card --- by AMP. Includes software,
cables, microphone.
V-Synth wavetable synthesizer
Wave SE sound editor
Stratos MIDI software
MIDI Tune-Up
Windows Sound System software
Cardsoft Card and Socket Services
Traveler adapter module
Microphone
Compliant with PCMCIA Release 2.1
12-bit recording and playback
5 sampling rates
Turtle Beach Hurricane architecture
Thin-profile Type II card
requires:
Type II or III PCMCIA socket
386, 486, or Pentium processor
4MB of Ram
$65 + shipping..

------------------- F L A S H L I G H T S ---------------------

4-D cell (2x2 style), krypton bulb. In box, never used.
$5 + shipping.

6-D cell multifunction lantern. Sleek tubular style with
bright incandescent light at end, 6W fluorescent bulb
along bottom, and flashing red and yellow on top. Also
has electronic sonic alarm that can be switched on with
the flashing lights. In box, never used. $12 + shipping

3-C cell Eveready worklight-style. Bright yellow with
hook for hanging, frosted bulb to diffuse light over area.
Unused, but no box. $5 + shipping

Batteries NOT included.....

COCA-COLA caps. Red cloth, white lettering. New.
$8 each + shipping. Only 9 available.

..... FOR YOUR DRIVING PLEASURE .....
1929 Mercedes SSK kitcar on VW chassis. Just completed, never titled.
Yellow, with brown fenders and running board, tan convertible top, side
curtains, and tonneau cover. Gold trim instruments.

COBRA 18-ULTRA CB ---- 40 channel, pushbutton tuning, with 3
NOAA weather channels. Includes microphone, but no mounting
hardware. $ 35.

LEXMARK/IBM PORTABLE PRINTER 5183 ---- powered by rechargable
battery or AC wall adaptor (included), this printer is only
11.5" x 3.5" x 2", and weighs about 2.5 pounds with battery
in place. Using silent thermal print head, it will print on
either thermal fax paper or on regular paper using the enclosed
thermal transfer ribbons. Very quiet in operation, and because
it runs on a battery, it is completely portable, for use with
laptop computers anywhere. Includes parallel port cable. $89.
.
ANADEX WORD-SCRIBE PRINTER ---- heavy duty dot matrix printer.
Multiple ports, but no literature so only parallel port in use
now. Tractor or friction feed. Fast, good quality; 17-inch
platten. $ 15
.
add shipping to all prices, only in US....
if interested, leave e-mail...

It is great. I use it now exclusively.

It works very well and the PC interface is much more enjoyable than a
old-style scanner. The recently added spectrum analyzer is incredible.

The only problem I can see is that it is not very good on shortwaves.
Then again, no wide-band scanner is, so that would be asking too much
for the money, I suppose...

5457. New Face of Terrorism: Radio-Frequency Weapons

Newsgroup: rec.radio.scanner
Date: 1997-06-24 00:00:00 UTC
From: ki4je@bellsouth.net
Message-ID: <MPG.e1980f944755b379896bd@news.atl.bellsouth.net>
Source record: 193533

I found this fasinating to read. Particularly the hand held bomb that can take out a site using EMP! Does anyone know how one is actually constructed? HAMS have known about 'terrorists' for years who have jammed our repeaters. I can see how some of the items available at the common hamfest can be converted into a terrorist weapon after reading this story.

New Face of Terrorism: Radio-Frequency Weapons
By ERIC ROSENBERG
c.1997 Hearst Newspapers
WASHINGTON -- It's early on a Sunday morning and a minivan prowls the streets of a major U.S. city, perhaps Washington, D.C., or New York.
In the back is a tube-like device, about two feet in length, connected to several boxes of electronics. The vehicle drives around its target, a building full of government computer systems. The device fires off electromagnetic pulses aimed at the building.
Unlike the Oklahoma City or World Trade Center attacks, there's no explosion, no noise, no deadly calling card, no forensic evidence.
But the damage is nonetheless severe. Electronic brains in computers in the building are burned out or crippled for days. If the attack were to take place in New York, electronic money transactions might be wiped clean; confidence in the U.S. banking system could be undermined.
This hypothetic scenario, described in recent congressional testimony by a retired three-star Army general, makes U.S. planners nervous - because the threat isn't science fiction.
While intrusions by ``hackers'' - experts who can electronically tap into computers - are a well-known threat to computers, electromagnetic pulse weapons are relatively unknown.
According to published reports, British military officials suspect that these devices, also known as radio frequency or high-powered microwave weapons, already are in the arsenal of the Irish Republican Army. In fact, the British government suspects that radio frequency ``guns'' may have been fired last year against computers used by the London futures market.

In Russia, mobsters ``have successfully used high-energy devices to put alarm systems out of operation,'' Manuel Wik, a Swedish military scientist, told a computer warfare conference last month.
``One Russian general I know is worried about the increasing number of cases in which terrorists have been using electromagnetic devices,'' Wik said.
The Swedish banking industry has asked the military to advise banks on how to counter the weapons. Meanwhile, Swedish scientists recently demonstrated a large-scale radio frequency weapon by focusing a beam on a car's electronics, stopping the vehicle at more than 100 yards.
The Pentagon is developing high-powered microwave weapons to disable cruise missiles, aircraft or artillery fire in mid-flight, according to a report by the Defense Research and Engineering office.
But it's not the high-tech systems that concern defense planners as much as it is the low-tech systems, as represented by the van scenario.
``You could take a surplus radar transmitter and concentrate a beam and just sit out on the street corner and blow away virtually any computer facility that had no protection,'' said John H. Hall, an electromagnetic pulse expert and president of the Fremont, Calif.,-based company Integrated Wave Technologies Inc.
``This stuff has been around for years but nobody has talked about it. And for every amateur saboteur, it's a new and exciting technology,'' Hall added.
As the technical know-how proliferates around the world - some Internet sites tell how to build crude variants of the devices - scientists are worried about the consequences.
``Terrorists, by electromagnetic means, could create chaos,'' said Wik. ``They could direct their weapons against computer centers, upsetting those functions depending on computers. They could direct microwave guns towards traffic on highways and cause malfunctions in cars.''
There are two basic classes of these weapons. One uses amplifiers and antennas similar to radio transmitters, but they shoot concentrated microwaves. These transmissions destroy electrical components by inducing voltage surges in the target.
A less-known class uses explosives wrapped in special antennas to create a much more dense and effective electromagnetic pulse. These devices can be made to fit in the palm of the hand.
The United States is starting to take notice of the potential threat.
Rep. Jim Saxton, R-N.J., the chairman of the Joint

Economic Committee, which last week held a hearing about electromagnetic pulse technology, called it ``a devastating new weapon ... currently in enhanced development today in Russia.''
The head of the President's Commission on Critical Infrastructure Protection, Robert Marsh, said he was not aware that such a weapon had been used against United States facilities but he warned: ``We have to keep our eye on that as a potential weapon for the future.''
Retired Army Lt. Gen. Robert L. Schweitzer, who was on the Reagan administration National Security Council staff, is calling for greater government attention.
He said the government should impose the strictest possible export controls on the technology to prevent proliferation.
``Today, there is a new class of radically new and important radio frequency weapons,'' Schweitzer warned Saxton's panel. ``And in this case, the horse is out of the barn. Transfers have occurred and are occurring.''
Schweitzer is working with the Alexandria, Va.-based defense consulting firm Eagan, McAllister Associates on a study of radio frequency weapons for the Pentagon.
While the devices are worrisome to planners, experts say countermeasures exist, including specialized building construction materials and unique voltage protectors. In addition, fiber optics, which are immune to most pulses, could be used to replace cabling in buildings.
Government facilities that rely almost exclusively on computers such as the code-breaking National Security Agency, are believed to have countermeasures in place.
But most office buildings do not.
``There could be defenses against this, but today most people are ignoring it,'' Hall said.

I love it. In my case the computer didn't cause any problems, but I
know it can happen as one my friends had problems initially with a
noisy computer, but managed to sort them out by using an RF filter in
the mains. The manual contains suggestions how to deal with that.

On the whole, it is a fantastic unit.

5461. 760XLT cellular mod...HELP!!

Newsgroup: rec.radio.scanner
Date: 1997-06-24 00:00:00 UTC
From: "Christopher S. Ingham" <chris_i@earthlink.net>
Message-ID: <01bc809c$ed1bb200$4f982299@cingham>
Source record: 193537

Hello all -

I was at a friend's house last week watching him modify his 760XLT to restore cellular coverage. He and I had read in a number of places about how easy this mod is.

So, he very carefully did as we had read. He lifted pin 20 from the main chip in the radio and carefully soldered a small jumper wire between it and pin 19 next to it. Although he's not an electronics technician, he's taken enough electronics courses in school to know how to use the soldering pencil. Well, in order to shorten this rather long post, I'll get to the point: It didn't work! He closed up the scanner and tried to enter a frequency of 880 Mhz. He got an "Error" message for that frequency and all the others between 870 Mhz and 890 Mhz. He re-opened the scanner to solder the jumper again in case he had a cold solder joint. No go.

Here's the main reason for this rather long note: Did Uniden implement a hardware or firmware change at some point that made it impossible to restore cellular coverage? Should he have tried a different mod based on a change implemented by Uniden? Any suggestions on what he can try next?

Any guidance you can give me will be passed along to my friend and will be _much_ appreciated!

Thanks in advance!

Chris I.

>the freq can be off as mutch as .015 +/- . I understand that some
>radios are off freq. but this is occuring 4 out of 5 times I get a hit.

You could be describing a few different problems, it's not clear.

Are you saying that the frequency displayed on the Scout is different to
that shown on the 8k?

Are you saying that the displayed frequencies are identical but that the
"real" frequency is a few kHz away, requiring you to retune the 8k to
hear the signal properly?

If it's the former, then you've got either an offset or too large a step
size (or both) programmed into your 8k.

If it's the latter, then either your Scout or 8k or both need
recalibration.

Perhaps you could explain the situation a little more clearly.

Tim.

Careful who you paint with that wide brush... I'm not one who thinks
all cops are JBT's. The fact is that some states have ridiculous
laws. Cops have no choice but to enforce those laws.

I have sympathy for most police. It is not an easy job. However,
when I run in to an obnoxious cop (or any obnoxious person), I don't
argue with them. I'm usually a patient man. I can sort things out
later.

Take your JBT thread somewhere else, fellah. FYI, it has been in my
kill file for some time...

I've seen post about the Ramsey speech scrambler but have never seen one. How does it look? How does it hook up to the scanner? Is it real bulky? I have an AR8000 and was thinking about ordering the speech inversion chip that I once saw advertised. Would this be better than buying the Ramsey? Thanks for any help.

It's a good price but you will probably pay tax on top of that.
On the other hand if you mail order you will have to pay a shipping
charge.
Research the different mail order places and weigh each one. Plenty of
places to buy from...

Monty

From the FAF - Frequently Asked Frequencies
on ftp://oak.oakland.edu
as /pub/hamradio/docs/misc/scanner.faf

Cellular Telephone [22.902]

Chs Freqs (base) System Use

991-1023 869.040 - 870.000 A - RCC voice
1-312 870.030 - 879.360 A - RCC voice
313-333 879.390 - 879.990 A - RCC data
334-354 880.020 - 880.620 B - Telco data
355-666 880.650 - 889.980 B - Telco voice
667-716 890.010 - 891.480 A - RCC voice
717-799 891.510 - 893.970 B - Telco voice

Transmissions are FM (some systems are adding digital).
Channels are 30 kHz apart. Mobiles transmit 45 MHz below the
base (824.040-848.970) and are usually repeated by the base.
Channels 991-1023 are also identified as Chs 800-832.

Television [73.603]

Ch Range Video Audio

2 54 - 60 55.250 59.750
3 60 - 66 61.250 65.750
4 66 - 72 67.250 71.750
5 76 - 82 77.250 81.750

Uniden Sportcat 150B Scanner
Please help, I can't hear SQUAT and I miss it real bad!!!!!!!!!!!!!!!
One day I turned on my scanner and there was no S O U N D , so I thought,
Boy this is sure quiet today, then I realized my speaker had taken a dump.
So if you can help me out with a speaker that would be great!!
A used one would work, but I would prefer a new one.
I've been told by a local dealer that it could be 2 months before they get
any in.
Well guess what, I would rather not wait that long.
Can you help???????????
Contact PANTH18251@aol.com
Thanks a bunch in advance........

They give you DLL API library and sample source codes for C++ and
Delphi/Pascal. Also a full DDE interface with descriptions.
You can also program it from DOS if you must.
All this info can be downloaded from
http://www.winradio.com/LITERAT.HTM

I have also seen a complete listing of I/O ports with commands
in one of recent World Scanner Reports by Bill Cheek.
There has been some good info about this scanner in WSR.

Hope this helps,
Pete

5485. 2-way Radio Tech on USENET?

Source record: 193561

Is there any mailing list of usenet group for 2-way radio technicians ?
I have been trying to find one for about a week now and have given up, I know there are a lot of us on the amateur usenet groups.

I think this would be a great idea, we can all get together and chat about fixes, and different systems with other techs and most of all techs that are most probably from other areas other than our own in case we are worried about co-mingling with the competition!

Yes, I know local competitors could also be on-line but as long as we keep everything on a technical level it should be a great way to network!

>I own a radio shack pro-34 scanner, which is FM reception only
>and I am looking to add AM receive capability to it.
> Does any one have a suggestion on how?
>
> Markos@webtv.net.

The PRO-34 is not FM only. It receives AM in the VHF-air band.

An AM/FM switching modification is pretty simple to perform
in many GRE-made scanners which already contain AM and FM
detectors, e.g., PRO-34, PRO-39. The CPU usually provides a
logic level output line which is connected to base of a
transistor switch or input to a simple IC switch. That
switch selects either the FM or AM detector output to be
routed to the audio amplifier input.

While I don't have a schematic for the PRO-34, I will use
the later PRO-39 as an example. Pin 13 of the CPU (located
on the logic PCB) provides +5 VDC to resistor R227 (on the
AF PCB) in NFM mode and ground (approximate) in AM mode.

One could insert a single pole, three position switch
between CPU pin 13 and R227. The common on contact would
connect to R227. The other 3 contacts could be connected
to:

1. CPU Pin 13
2. 5 VDC
3. ground

When the new switch is in position 1, the scanner would act
normally -- AM in VHF airband, NFM elsewhere. In position
2, the scanner would use NFM mode regardless of frequency.
In position 3, the scanner would use AM mode regardless of
frequency.

I recommend you order a PRO-34 Service Manual from Tandy so
you can determine the relevant components and their
locations specific to that model.

Did my post on terrorism using EMF weapons or
surplus radar units make it to alt.scanner or
rec.scanner? I have this neat usenet offline program
AMEWARE GRAVITY and
it appears when hangdling multiple posts that once
I read one article it doesn't download any crossposts.
I thought it downloaded them an merely marked them as
read but I guess it doesn't even bother to retrieve
them if already read somewhere else.

BTW they found two pipe bombs here in Atlanta today
when they did a drug takedown in Chamblee.

Also note for those that wrote and asked how can they
make a handheld EMF device using an antenna an explosives
check out how they design an Atomic Bomb using web
resources. Yes the information is still there if you
know how to search for it! Since radio waves work at the
speed of light it apopears that they can be generated and
focused before the device is destroyed by the explosion.
This knowledge on making a handheld device is an
outgrowth of the knowledge gained in how explosive lenses
work when designing nuclear devices IMHO.

more than likely SARSAT hadn't past over that region at the time
you heard it, and so AFRCC at Langley wasn't going to know about
it until they have a confirmed hit, even then, they wait till the
second pass before they contact an organization to perform a SAR.
Did you do anything to follow up on it other than call Garner?
Could you of drove around and determined how strong the signal was
from one position to another? I spent 10 years in CAP, which is
offically tasked by the US Air Force with Air and Ground Search And
Rescue, on 121.500 and some missions on 243.000, I was a Comm officer
with the Ocean Springs-Keesler Composite Squadron, Civil Air Patrol
22048... I use to hunt ELTs like there were no tomorrow...

I miss doing that sometimes, but my job has me locked down and I can't
devote any time to that anymore... :(

Take it back to RS. They have a 30 day refund policy. Try a radio in
the store and see if it does the same. If not, replace with another
radio. If it does, try a different model. It's your money! Get what
you want. Not what the salesman (or women) is hawking. If, when you go
back to the store, the salesperson is not helpful, tell them that you
want to return the radio.

P.S. Alot of the hand held radio's out there have terible sound. There
are a few possible work arounds. RS has a clip on speaker that looks
just like the mic/speakers that the police use. This will allow you to
clip the radio on your belt and walk around and hear the scanner just
fine. There are also some speaker units that plug right in to the
jack. These are ok if you don't mind a box sticking out of the top of
your hand held. Earphones are also an option.

The scanner and andtnna need the same characteristic impedance for
minimum loss. Very probably this is 50 ohms. About the only 75 ohm
usage is TV/cable TV.

Selling an AR-1500 scanner $250. Great condition, with all accessories, in box. Gets cellular. Bought new 6/93. Am located in California. Here is a list of features I found on the net for the AR-1500. Please email any questions. Thanks.

900 general channels of non-volatile scan memory. (100 channels dedicated for search and store feature).
10 individual search banks. (Bank 9 dedicated to search and store)
Reception in FM, wide FM, and AM modes.
Contains a beat frequency oscillator (BFO) for reception ofsingle side- band (SSB) and continuous wave (CW or Morse) signals. It can receive both upper side-band (USB) and lower side-band (LSB) transmissions.
Continuous coverage from 500 KHz to 1300 MHz with no gaps.
Searches and scans at 20 channels per second.
Any channel can be the priority channel which is active in search, scan, or manual mode.
Search increment is user-selectable in any steps of 5 KHz and 12.5 KHz up to 995 KHz.
Tuning knob.
Channels, scan banks, and search banks may be locked out. Also, individual frequencies during a search may be locked out.
10 db attenuation switch
Automatic search and store function.
Delay or Hold feature.

Funniest dispatch I heard was when I was living in Concord, Ca. I lived in a bad neighborhood which the cops would sit on. Two were in the parking lot of the apartment complex, so I turned on my scanner. To an officer in another part of town came the call, "Woman reports a naked white male in front of her door, not well endowed". The guys near my place got a good laugh, and so did I.

Attention All Scannists,
In an effort to provide everyone with the best knowledge available for purchasing a scanning radio, antenna, book or piece of software, I have created a User Opinions page. This page exists for you to post your personal reviews and thoughts of scanning related items.
I ask each and every one of you reading this message to consider the knowledge and experience you have gained from your monitoring and put it towards helping this effort.
No one expects a thesis to be written. Just your honest comments on what you do and don't like about a particular product. It can take but a few minutes yet make such a large impact to those of use who will make use of it.
To anyone who has ever used the Internet to do research before making a purchase, I think you can see how valuable a resource such as this can be.
Several people have already been unselfish enough to post their thoughts about items they have used. I thank you and hope that others will follow your lead.
To learn more, point your web browsers to

http://www.qsl.net/n2mca/OPINIONS.HTM

Thank you for your time and consideration!

Strong signals,

Yes Shawn, and I'm looking for a VIRGIN!

Cheap scanners are usually FM only except for the aircraft band, which
is below 136 mhz. You need AM in the 200-400 range, and that's going
to take a quality scanner and bucks.

Good luck

5517. BC235XLt or MVT7100??

Newsgroup: rec.radio.scanner
Date: 1997-06-25 00:00:00 UTC
From: Steve N <sgn1@ra.msstate.edu>
Message-ID: <33B0CFC5.61D@ra.msstate.edu>
Source record: 193341

Well I have finally decided to buy a scanner. First off, I would just like to say that all of you have been very helpful on this newsgroup and all of the web pages I have come into have been of great help. After looking at all of the avaliable products, I have decided on either the BC235XLT, becasue of it trunktracker ability, or the MVT7100, because of it wide, no gaps, high sensativity coverage. Also I was thinking about the 7100 because I have seen a good deal at only $305 at Bandercom. What do you guys think? Which one should I get? Has anyone dealt with Bandercom before? Are they good?

I had orginally wanted a beartacker thinking that would save me from speeding tickets, but after help from this group, I realized they are in no way fool proof, and the money should be put towards a scanner. Am I right in saying that I can just program in the scanner frequencies that the beartracker uses? And am I right in saying that if a state changes radio systems, the beartracker is useless?

Thanks again for your help
Steve

Source record: 193342

Will,

The case for the 230XLT will fit - the radios are virtually identical except for the addition of the "trunk" key on the 235XLT. However, the case for the AR-8000 is also nearly a perfect fit, and in my opinion, a much, much nicer case. Only minor alterations are needed to use the charging cord while the radio is in the case. Other wise if works great. Call EEB at 800-368-3270 for price and availability.

> I like the Panosonic style but don't think they are digital.
> Thanks for any help you can give me
> Russ.

From a technical standpoint there are no "totally private" cordless phones. They are all radios and can be intercepted. Some are just a lot harder than others.

From a practical standpoint, any of the 900 Mhz *spread spectrum* phones will provide you adequate privacy from run of the mill eavesdroppers. In fact, anyone with the "need" or desire, and the know-how to hack your spread spectrum transmissions would probably find it easier and more cost effective to just monitor your telco wire pair and listen in on any phone you use.

Don't listen to salesdroids at stereo stores. "Digital" does not necessarily mean spread spectrum - check the specs on what you buy. Both frequency hopping and direct sequence SS systems will provide a good level of security. My experience (having an Escort at home for 18 months, a Ricochet modem for year, and using SS phones at work) leads to my opinion that frequency hoppers are preferable in cordless phone applications.

Regards

How 'bout these?

Not long ago, I heard two officers discussing a female prostitute walking around town trying to find someone who would buy her baby. Being in the news business and recognizing this as news, I called dispatch to verify. It turns out I was listening to the car to car channel and one officer was simply telling the other about something he saw on TV. What I hear didn't really happen.

Once I heard Irving Fire dispatch an additional engine to a 3 alarm apartment fire with the instructions not to forget the marshmallows.

My all-time favorite is when I called dispatch after hearing that a DART bus had been involved in an accident. I called to ask if there were injuries. The dispatch supervisor (ever the jokester) said, "Are you kidding? It was a city bus wasn't it? Of course there're injuries! Everyone on that bus is sitting on the curb with one hand on his neck and the other holding a lawyer's business card!"

You don't give any idea as to what "inexpensive" would be in your budget.

If $200 is within your range then RS has (had) the PRO-60 on offer in the States for $199 - this is a pretty good buy and worth considering.

Other than that look out for sets like the PRO-43, AR1000 and possibly the AR1500 on the used/secondhand market - these all have the 225-400MHz military airband on them although as they all have the capability (99% of 43's anyway) for receiving the frequencies used by cellular they hold their price and will probaably be around that of the PRO-60 mentioned above.

Good look in your search.

Intend to visit the air show at ANG Base North Kingston, R.I. this
weekend. Windering if anyone has an air show frequency list perhaps
from shows there of recent years past.

Primarily interested in the air boss and show discreet.

If I understand you correctly, you should ask someone in another
country to send the scanner as a used one (opened package). If it's
a new one, the custom takes the tax.

Neal,

From my house NW of Columbus, on the portable antenna on TT, I hear your system quite regularly on the Grove City System. Grove City is made up of a 5 channel system, and when ever a channel is assigned on a freq that your system is using as a control channel, a hetrodyne is heard. I dialed up the freq on my R7000 and the discone on the roof and got a very good signal from Warren County. 800Mhz does get occasional 'ducting" from some distances, but also gets much improved range from early am hours and late evening. Our conventional 800Repeater located at my house has some pretty noticeable differances in signal strength in the AM. Grove City's system is not located on much of a Tower as it is not that strong at my house while Columbus is very strong. Don't know where it is but for you to hear it probably indicates some ducting.

Vic, The overall concept is well known and well reasearched by the
military. When I was just out of college I worked at Pax River Naval
air station where we tested our aircraft for vulnerability to
Electromagnetic Radiation.

The tests were EMV tests (ElectroMagnetic Vulnerability) the tests
were intended to ensure that the electronics and sensors, as well as
pyrotechnics, would not be damaged, shut down, fired, altered,
whatever by the Electromagnetic fields in which they operate. Across
the years virtually any military item has been tested for
vulnerability, By Contract Requirement.
Any military person who is in a position of authority already knows
this. Now vulnerability of laptops and PCs bought from comercial
vendors is something different. However you would not find the control
system for our nuclear capability having the same problem.
Want to find out what kind of tests are run, Try mil-std-6051 or 461
for starters. What levels are they tested to, Thats the classified
part.
What vulnerabilities have I seen, some absolutly fascinating ones,
helacopters that danced when the radar pulsed. Were the problems fixed
YES.
By the way EMP is a phenominon that was in the news 15-20 years ago
when it was on the 'news magazines' like 20-20 and such that a nuclear
explosion ABOVE a city would devastate the city by knocking out all
radio communication (your a ham, what happens when the atmosphere is
IONIZED) and Electricity (overloads on monitor circuits, ionization of
transformer cores) which would result in the loss of other basic
services. All electronically controlled devices inoperable, computers,
tvs, vcrs, microwaves, AUTOMOBILES.

This is nothing new... Just notable

5536. Why can I trunk track from 60 miles away?

Newsgroup: rec.radio.scanner
Date: 1997-06-25 00:00:00 UTC
From: "Neal R. Fildes" <fildes@att.com>
Message-ID: <5or4po$ljc@newsb.netnews.att.com>
Source record: 193360

I normally monitor our local trunking system with a AR8000 and Seeker-800 antenna.
The system is "warren county" with sysid 1F3E. Last night was unusual in that
my scanner kept stopping on data bursts on some of the system's voice channels,
even those that are not part of the official '4' frequencies that the radios are programmed
to look at to find the data channel. At first, I thought perhaps the system was going
flaky, but after watching for a minute, I noticed that the data bursts were at S0
whereas the official data channel was S7.

So, I went to my 'shack' and plugged my data slice in to the discriminator tap on my 8000.
Trunker identified the system ID as 0x4221! so it could not be a flaky Warren County
system.... By moving the scanner around a bit, I was able to achieve good data lock and
watched as calls were assigned to subsequent channels.

IT TURNED OUT THAT EACH OF THE 5 CHANNELS IN USE ARE IDENTICAL TO THOSE ASSIGNED TO WARREN COUNTY!

referring to my Police Call listing by frequency, I identified this set of 5 as belonging to
City of "Grove City". Mapping that from Yahoo showed me it is a town just south of
Columbus, about 60 miles away!....

So my question is, what was so special about last night that I was able to trunk-track over 60 miles
away? I didn't think 'skip' would be a factor for that distance and frequencies in 800mhz range...

Suprise!

I bought one two months ago, and at that time there were four left in Connecticut. The reality is that most stores' shelf demo is OLDER than the other units in stock. If a store has a demo, check it out.

5541. Opening AR8000 case?

Newsgroup: rec.radio.scanner
Date: 1997-06-25 00:00:00 UTC
From: Keith Grant <khgrantnospam@ix.netcom.com>
Message-ID: <33B13CF1.5FA8@ix.netcom.com>
Source record: 193365

Can anyone describe how to open-up the AR8000? I havn't tried it yet, tho I notice two tiny phillips screws on each side of the case. Any tricks/cautions I should know?
How do you get the knobs off? Don't they just pull off? I tried a strong yank and they didn't budge! I hope they are not glued!.
My volume control is getting very stiff to rotate. I think there must be an O-ring on the shaft that is binding up or dirty. I want to disassemble and clean/lube if I can.

TIA

Keith Grant

5543. Uniden BC 350A Mobile- Comments & Ant Sugg

Newsgroup: rec.radio.scanner
Date: 1997-06-25 00:00:00 UTC
From: igus@aol.com
Message-ID: <19970625160501.MAA18125@ladder01.news.aol.com>
Source record: 193367

I recently ordered a remanufactured BC 350A from Damark Industries. The price was right, and the refurbished Sony products I have bought from them in the past have worked great.

Mobile scanners are legal in my state... so far. I plan on mounting this unit in my truck, but need some suggestions as to an antenna setup.

I've heard that the splitter arrangement with the car radio antenna is pretty poor. And I recall (maybe) about someone posting a message about using a length of stripped coax, and that it did a great job.

Also, any mods out there for this scanner? I know it is not the greatest one in the world, but it should make my commute a little more interesting.

Thanks!

You're right, but tropospheric ducting or sporadic E-layer propgation
could. Big problem here when another Sheriff's department and a Chicago
PD freq come blasting in on the local freqs. OTOH, it also indicates a
"band opening" and can make for some interesting ham radio contacts. :)

Chicago Tac unit was dispatched to investigate a selling drugs
complaint. Complainant stated that drug sellers took his money and
produced no drugs.

I don't flame or ridicule, join me in making
this newsgroup better.

Listen in, Boat Watching with a VHF
Scanner

Even the most inexpensive scanners are capable of receiving VHF radio
communications. The
majority of radio traffic carried out on the Great Lakes is in the high
VHF band with frequencies
ranging from 156-157 MHz*. Below is the complete listing followed by
regional listing.

Read about my scanning set up

==========GREAT LAKES FREQ.==========

*A note about VTS

Vessel Traffic Services are in place at several sites around the Great
Lakes.
These stations are set up to provide mariners with traffic information
to add to the
safety of vessels when transiting cramped, high traffic water ways.
The service
requires vessels to call in at certian points and then relays that
information to other
vessels. This is Great if you own a scanner and live in the area.

Detroit area maritime Frequencies

Coast Guard

157.175--St. Clair

157.050--Port Huron/ Belle Isle

157.125--Sarnia Ont.
161.875/157.275 (duplex)--weather reports from other stations/ships

157.150--Detroit group
157.100 (Marine Safety Broadcast; working channel from 16)

156.700--Macomb Co. Sheriff marine patrol

156.800--Calling and distress (monitored by all)

381.800--Helicopter (out of Selfridge ANG, tower: 340.700; can also be heard on other C.G. VHF channels during operations)

161.900, 162.000 Detroit, 161.875\157.275 (duplex) Sarnia-- marine operator

161.775--Continuous marine broadcast, Leamington and Kincardine Ont.
161.650--Continuous marine broadcast, Sarnia and Port Burwell Ont.

VTS Sarnia

All ships over 20 meters, transiting the system between Detroit river light
in lake Erie and and Huron cut lights 11+12 in Lake Huron, must report in on
these three channels:

156.550--Sarnia traffic (ch.11) from Huron cut to St.Clair Crib Light.
156.600--Sarnia traffic (ch.12) from Detroit River Light to St. Clair Crib.
156.650--Sarnia traffic (ch.13) back up for ch. 11 + 12

Commercial

156.450--Yacht clubs

156.500--Mail/supply boat J.W. Westcott II; Port Huron Pilot office.

156.500, 156.900-- tug companies.

156.700--Sterling fuel dock.

156.950--towing/salvage.

156.400, 156.300, 156.275--ship to ship

Soo area maritime Frequencies

156.600-- Soo Control-- St. Mary's river traffic service
From De Tour Reef Light to Ile Parisienne light.

156.700-- Soo Lockmaster

156.400-- Soo Warehouse--Supply boat

St. Lawrence Seaway and Welland Canal

156.700-- Seaway Beauharnois--Sector 1

156.600-- Seaway Eisenhower---Sector 2

156.550-- Seaway Iroquois-----Sector 3

156.650-- Seaway Clayton------Sector 4 (St. Lawrence River portion)
156.650-- Seaway Sodus--------Sector 4 (Lake Ontario portion)

156.550-- Seaway Newcastle----Sector 5

156.700-- Seaway Welland------Sector 6

156.550-- Seaway Long Point---Sector 7

HF on the lakes

Thanks to Steve Fisher for providing the following: Here are some HF
freqs
used by various shore stations around the lakes. With VHF and now
cellular
phones these freqs end up used most often to provide weather reports and
notice to mariners broadcasts. Every great once-in-a-while you will hear
a
ship to shore phone call on them. All listed are upper side band unless
otherwise noted.

>
> /\/\|k.e

It was not a blast. Direct questions were asked and some replied with indirect answers. Some felt it necessary to reply and really don't know what they were talking about, others just tried to help. I guess I really don't care who it is, I question anyone from the designer of the Scanner to Motorola Engineers. I want to know something I'll poke around until I find it. I had a direct question and was not satisfied with the answer. Any time this happens I'll keep at it. I don't just accept things because someone says that "this is the way things are" I look for the Why and How.

If you don't ask you'll never know :-)

> tho I notice two tiny phillips screws on each side of the case. Any
> tricks/cautions I should know?

Just take one screw out from each side - the one of the "front" half of the
case.

Take the two screws out from the Battery Compartment.

Radio will then split into two.

> How do you get the knobs off? Don't they just pull off? I tried a strong
> yank and they didn't budge! I hope they are not glued!.

If you having trouble try a flatbladed screwdriver down the "hole" and gently
lift.....they come off without much trouble.

> My volume control is getting very stiff to rotate. I think there must be
> an O-ring on the shaft that is binding up or dirty. I want to
> disassemble and clean/lube if I can.

Could just be the rubber knob but if you want to remove the RF Board
then you will also need to remove the three locking nuts on the
shafts of each dial (down the hole on the top).

Hope this helps.

Wrong. Even more so when you are talking about a receiving antenna being used over a wide spectrum. If you look at the impedance of your antenna as you tune across the bands the first thing you will notice is the impedance goes up and down like a roller coaster. It is rarely (the antenna) ever at 50 ohms. Most of the time it isn't even close. With that in mind you go to

http://www.cablexperts.com/attenuation.html
and compare losses and pick the 50 or 75 ohm cable that has the lowest loss and is priced in your budget. I only suggest this web link because they have the chart, I know nothing about them in regards to their business.

Glenn

COAX CABLE ---- heavy-duty, 1cm diameter, black plastic
covering, with foam dielectric. New, was on wooden spool
until I unwound it to get approximate length of 300 + feet.
No marking on cable; spool label says 1GHz. Was left
after cable TV upgrade, so probably 75 ohm. $20 + ship.

To tell the truth the COP wanted to send in officer with automatic weps
and shoot all looters on sight. The black mayor vetoed the idea. When
your hands are tied there is not much choice but to run. Even still I
find it funny that only law abiding gun owners were able to save
themselves, yet the Kalifornia legislature is still wanting to pass
anti-gun laws. Guess they want to save the rioters from angry citizens
in the future?

I may be wrong, but I seem to recall that ELT's can be tested for a few seconds on the hour. Perhaps you were hearing a test? Did the signal persist?

Time to file that Federal Civil Rights Law suite and bankrupt the
county. You and the wife should seperate til after the trail and claim
alienation of affection etc. Both sue seperately. Just legal fees
alone will kill a small county.

You can get a GE/WIZ chip installed in your scanner for around 100 bucks (including parts and labor). IT will stop you from hearing those beeps and keep your scanner-scanning.

I have one of these that I built too. It works great on my
Motorola Secure Clear (not!) cordless phone. My last apartment was on
the second story, and I used to pick up a conversation on every
channel (back then they only had 10 channel phones). Funny thing is, I
heard all the juicy stuff coming from people who used conventional
cordlesses. Go figure.

Was it contiunous? Was your clock right? ELTs can be tested in the first 5 minutes of each our. The test is not supposed to exceed three audio sweeps. If it was a test maybe your clock was right and the guy tetsing the ELT needs to check his watch.

Regards

I love it! I haven't even had my Trunktracker 24 hours and I've already heard:

three pursuits

a conversation between two officers where one of them mentioned a suspect talking about licking someone's vagina

a standoff between police and a 5150 subject who was holding a woman hostage and threatening to kill her. Big deal, right? Wrong. The entire incident was broadcast over the police frequencies because (I think) the officers gave the suspect a radio so he could talk to the negotiator! I got almost all of it on tape. Definitely a keeper!

I'm not kidding, either. I live in a city full of crime, so this kind of thing happens rountinely, except for the broadcast of the hostage situation.

I would like to have some help for getting the radio license
in "Canada" (not U.S.).

What do you have to know for:

- Aeronautical License
- Marine License
- Land License

Are the tests going to be similar to the ones we have in amateur radio
?

Also I would like to know what kind of things you can do with these
licenses.

Thanks for your help !!

>"SHARING" means both parties get something. What are you giving?

C'mon guys! Where in hell would there be "a site that has fleet map settings for everywhere" like the original guy was asking? Fleet map settings are being discovered by trial and error by people who own TrunkTrackers (and other software) and distributed as it slowly becomes available. Discoveries so far are more or less accurate, but we're all still learning how to find the bloody things.

Then along comes some newbie who wants all the information neatly collected for him in one place. That would be nice, but too many people get onto Usenet and other online forums demanding that the information they want be laid out for them, instead of doing their own research and finding out for themselves. And heaven help the poor sap who has the gall to suggest that anyone [gasp] buy a book!

What John observes here bears emphasis. The Uniden case
for the the Trunktracker leaves alot to be desired. It
is hard to put on the 235xlt and then it doesn't even
protect the keys or the lcd window from being scratched!
Spend the extra $15 and go for the AR8000 case which is
far nice in quaility.

While you are at it pick up a stubby 800MHZ antenna. I
got one that works well and makes the TT apear to the
unitiated as another cell phone. No hard stares as to
your using a scanner when in public. I took the cheap
belt clip off the 235xlt and the thing rides nicely in
both my shirt pocket or inside my suit jacket inside
pocket.

A 'BEARTRACKER' isn't worth the money many would spend on
it unless you live in a out of the way place with lttle
radio traffic. A true scanner would serve you much better
after you understood how to program it to serve you the
best. If any of the areas you live in have gone to a
trunking radio system then the only choice at present in
your price range is a trunktracker. It works well
although there is evidence they have quality control
problems in manufacturing these mass produced units.
Noting that can't be fixed but irritating none the less
if you get one that needs attention.

Again if you live in an area that is not very progressive
as of yet then the other radio will suit you just fine.
It sounds like a realitively good deal to me.

Hi Mike,

Another local metro user chatting with me late last night
via ICQ said that they also wanted to get together.
During the week can be rough for me at times since I work
12 hour days when I work. Of course I only work three or
four days a week. I will try to drop by if you set it up.
I like both suggestions. I will forward you a small
mailing list if you want it of local users.

BTW were is that file you were going to send me after the
hamfest? We could talk about making a local CDROM of
unique data for all. I have a Richo MP6200s CDRW. The CDR
media for write once is around $5 or less now. It takes
about an hour or so to burn a full 650MB CD if you do it
carefully. Faster if you don't care. Even faster if you
are putting only a couple of megs of data on the thing.

How come you haven't tried ICQ yet Mike? Last night I got
tipped to a talk group of an on going survaliance here in
Cobb County via an ICQ alert. I would never had turned
the radio on and caught that.

5597. USENET RUNKTRACKER 235xlt RESOURCE

Newsgroup: rec.radio.scanner
Date: 1997-06-25 00:00:00 UTC
From: ki4je@bellsouth.net
Message-ID: <MPG.e1b99d5ede8f8b29896c2@news.atl.bellsouth.net>
Source record: 193421
Cross-posted to: alt.bonehead.victor-healy,alt.radio.scanner,rec.radio.scanner

I have discovered that you can't really post the neat
stuff to these newsgroups or to trunkcom mailing list.
If you would like to experiment with posting your web
page to usenet you may use my newsgroup
news:alt.bonehead.victor-healy
You may post scanner related biniaries there also.
There are bots that try to kill these files but let them
find them first.

To post a web page use something like MSIE 4.0 and the
OUTLOOK EXPRESS tool. Set the format to html and select
eithr RTFM or BINHEX.
RTFM takes up more room but can be sort of read by any
newsreader. Those are the posts you see 'quoted
printable' html codes at the end of the message.
BINHEX is neater, more compact but must be decoded by a
base64 capable newsreader. Once decoded the resulting
file must be given and .html extension and then you can
view it in your favorite browser.

Try to save time for those who can't read a compacted
post in binhex by using the first word BASE64 in the
subject line so they don't have to download it.
There may be third party base-64 decoders out there.
I don't know.

MSIE and I suspect the latest version of Netscape 4.0 can
read these files directly from usenet and display them
properly. If you are on the cutting edge and want to try
hacking around with this new stuff add
alt.bonehead.victo-healy to your newsgroups.

FB> Base/Rptr mobile i/p offset

FB> 152-152 MHz 157-158 MHz +5.26 MHz (Taxi)

The last that I knew, the taxi frequencies were paired, but not repeated. Mobiles operate on the higher frequency, base on the lower, as you noted. Why this is, I don't know. The same applies on the 452/457 pairs.

I'm new to scanners and needed to get one for an upcoming auto race, so I headed to Radio Shack to see what they had. They had the Pro-60 on sale for $199 which seemed like too good a price with all its features including triple conversion. My brother has the model below that which was also on sale for $199. So I picked up the Pro-60 and they even threw in a 2 year warranty. Did I get a good model?

>
> TIA
>
> Keith Grant
To open the radio remove the batteries and the two small phillips screws
on the BACK HALF of the radio. The radio actually consists of 2 halves
that plug together. After removing the four above mentioned screws,
CAREFULLY seperate the two halves, keeping in mind that you are
unplugging one half from the other. The "plug" is in the form of IC
type pins extending from the back half into a socket in the front half
(I might have this reversed but for our purposes it doesn't matter).
Keep everything pretty straight when you pry the 2 halves appart so that
you don't bent these pins. Having said all this, It's really a lot
easier than it sounds.
As for the knobs: The can stay on during the seperation". I found the
best way to remove them (at least on mine) is to pry up from underneath
with my thumbnail, in essence pushing them off instead of pulling them.
Being made out of rubber I believe pulling only makes them grip on
tighter.
Hope this helps.

Source record: 193432

I have a PRO-2038 mobile scanner reserved at a RS
outlet store. They're on closeout everywhere for $89.97.
This deal is $69.97 and includes the $40 5-year
service policy. This unit is apparently not cell-
modifiable (4-94?) but I don't really care as I own
a 2022.43,2006. I'd like to have a permanent rig in
my old pick-up but some of the features of the 2038
bug me. Somehow I had the notion this unit was a GRE
triple conversion. Turns out it's a Uniden double.
Automatic 2-second delay would bite on trunked systems.
I like the 100 ch/step per second speed. The 50-channel
setup/limitation is funky. I dunno.
Opinions from Mssrs. Parnass, Cheek, Wells, and other
gurus welcome as well as yours. Please respond however
you prefer. Check out this mutant at:

http://support.tandy.com/support_electronics/18278.html

Thanks -- Bryan

try...

1. 443.700 for the space shuttle. Not real sure if this
is right but it's the only thing that comes to mind.

2. For repeaters try 147.825-
223.800-
223.920-
442.500+

3. For Ham try scanning between 145.0 & 147.0 as well as
440.0 to 450.0 (my friend gave me those ranges)

Realistic 2- channel VHF FM Transceiver Handheld model BTX 120
Factory- installed crystals for use on 151.625 MHz.
Two -Channel operation- lets you install optional crystals (plug-in type)
so you can operate on another frequency.
Range is opprox. 2 miles (depending on conditions).
Removable, Re-chargeable battery pack.
Hi-Lo RF power button.
Owner/ operator manual included.
Unit is in good shape and works well.
I believe this unit sold for $ 159.95 (new)
I will sell for $50.00 (includes shipping in the USA)
Interested???? Contact PANTH18251@aol.com
Thank you......

Just got my new Pop Comm in the mail today. This month, the subject of editor Harold Ort's column ("Tuning In") is today's sad state of ham radio in general, and in particular how YE OLDE FAHRTZ are doing their best to kill the hobby with their "holier-than-thou" attitudes toward new amateurs and would-be hams.

The last two paragraphs say it all:

"Can you seriously despise folks for operating on radio's fringes; freebanders, renegades, outlaws...when those making the rules, it could be argued, are no better: The lawmaker, trooper, judge, and jury?"

"If you were a newcomer, what would you think? My mom would probably say, 'Sonny, some of the old geezers are just angry that they weren't born today and can't start out on the radio like the new folks can.' Come to think of it, she might be right."

I just bought a Pro-60. It seems to work just fine when it is in a stationary upright postion. However, if I hold it at a slant, or move around with it, the sound is not stable (it wavers or comes in and out).

Does this sound like an antenna problem, a location problem, a general Pro-60 problem or just a bad unit?

I'd appreciate any advice.

Thanks.

You mean to tell me there are actually scannists who listen to other people's cordless phone conversations? Haven't you guys ever heard of the Electronic Communications Privacy Act of 1986, one of the most unenforceable laws ever :)?
All kidding aside, I have copied cordless phones at a distance of between 1.5 and 2 miles using the Rad Shack six foot scanner antenna (the big one with six elements) and a TV preamp with the gain set at 50% when the cordless channels are not too crowded.

I ordered my BC235 today, and I am also interested in a case.

I have a Pro 43, and I ordered a case from Design EQ, 415-328-9181.
It is heavy-duty leather, and has really protected my scanner over the
years.
I called to find out if he sells a case for the 235, but I got his
answering machine, so I did not find out yet. If he sells one I will
probably buy from him.

The 235 is supposed to be identical to the BC230,except for the trunk
key, so the case for the 230 should fit.

Happy Scanning,

Thomas

What is double/triple conversion? Is it filtering of static
I saw from your sig that you live in NC. Do you know if suburban
states like NJ also have a lot to listen to?

What are trunk radios? Am I right in thinking its a special radio that
picks up "Trunked Systems" which change frequency for the privacy of
the user? How common are trunked systems (if I get a scanner that
can't pick up trunked systems, will there still be a lot to hear)?

Am I correct in thinking that a scanner is only for recieving, not
broadcasting as well?

What kind of models would you recommend for a beginner, looking for a decently easy to use scanner, looking for a handheld model that can pick up the "exciting stuff", at a price range of around 150-250 dollars? <--- sorry for the newbie question :-)

Thank you for the help.

I occasionally pick-up Illinois on 800Mhz trunked frequencies. I think
they come from the Chicago area, and I am in the Milwaukee, Wi. area,

about 90 miles from Chicago.
Many systems share the same set of channels, and are normally enough distance apart not to interfere with each other.
I also on occasion pick up Chicago Police in the 460 Mhz band. Some of their channels are the same as Milwaukee, except they use a different CTCSS frequency.

The reason for this is probably not "skip". it is probably only due to unusually good "conditions", or perhaps "tropospheric ducting" (hope I spelled that right), or some other form of unusual(but not rare) propagation.

>

Last week I took a day and less than $20 and ran some good, separate,
heavy guage ground wires from the chassis of each piece of equipment
(computer AND monitor, too) on my "listening post" table to a braided
copper, common "bus". I connected this copper bus to the third plug
hole (the ground) of a wall outlet. I make sure every piece of
equipment is plugged in to the same circuit branch of the mains, as
well. This grounding effort has significantly helped not only my
shortwave reception (NRD-535D) but also the clarity of signals on my
R-7100. A good ground is more than well worth the effort.

Good listening!

5632. Air Show Report: Hanscom, MA

Newsgroup: rec.radio.scanner
Date: 1997-06-26 00:00:00 UTC
From: The Tron <tron@NOSPAM.elderhostel.org>
Message-ID: <01bc81e6$351103e0$3dd3c4d0@default>
Source record: 193258

Went to the Air Force air show at Hansom Air Base in Bedford, MA on Sat., June 21. Boy, was it hot for the Northeast. Brought the BC200XLT and the PRO43. The following freqs. had the most activity:

118.5 - Hanscom Tower (mirrored on 236.6 am) Air Boss
121.7 - ground
163.4625 - Base Security
173.5125 - Medical net
173.5875 - Fire/Crash (nationwide)

*141.85 am - Thunderbirds air-air, leader
*322.95 am - Thunderbirds air-air, secondary team (2-plane)
235.25 am - Thunderbirds ground, start of show
*413.1 nfm - Ground crew (T-birds?), mostly non-critical banter

* Same as Hanscom Air show in June, 1995

Short comm bursts heard on:

126.4 - acrobatic flight. other short comm
121.85 - acrobatic pilot to TV link
133.85 - short military com?
125.325 - " "

Had the Mass State Police freqs in a bank, but didn't monitory them.

Summary:

I like listening to security. They had to call the police to remove some drunk guy from the VIP area (managed by "Protocol Guides;" ha-what a euphamism for a bouncer). 11 am in the morning and wasted, this guy has a poblem. Lots of activity when some guy left a bag unattended at the end in one of the hangers. All radio comms stopped, they brougt in the munitions guys. WAIT! False alarm. Just his lunch! Lots of de-hydration and heat exastuiton on the med net. Drink that water, when you go to those air shows this summer, people.

Still mastering the scanner and finding freqs. Although I programmed in the parachute team, didn't hear any comm. Next time they come to Hanscom, I'll go the day before and sample the radio spectrum.

Went on the B-17, the Memphis Belle. This is an awesom plane. Those guys in WWII had some gaul - that thing is small inside. A "large" guy in front of me couldn't make in throught the V shaped catwalk in the bomb area and had to ture around. The gunners had not much room, either. Even the cockpit was small. They still had the oroginal radios on the plane. A separate 8"x2.5'x1.5 foot radio for each band, marked in KC (kilo cycles).

The lowest was ~250-500KC. Others were in the shorewave bands. Quite a contrast from the one of kind Satcomm plane, which tests new military communication systems. 22ghz, spread spectrum, encrypted and live satellite tracking - we've come a long way in 50 years.

Hints:

Don't make the same mistakes I did. Program your scanner at home a couple days before! I was busy and only set up the BC200XLT. I brought the other freqs on a printout and spent far too much time looking at my PRO43 and not the planes. Wear a shirt with a front pocket, so you can have your printout readily accessable, as well as have a place to quickly put your sunglasses while you use the binocs. Review your banks and make a note on an index card what's what. Here's a trick I discovered two years ago: If you don't know which freqs are active, put them all in a bank. Then, when the comm starts, lock out all the dead freqs. This is especially important for the Thunderbirds: they communicate in _very_ short bursts. It's nice knowing the stunt a second before it happens. You can also fill several banks. Make a note which freq's are active, then put them all in another bank (I use bank 10 for this). Saves having to lockout all the individual channels, and you can monitor the inactive freqs with the touch of a button. Plus, if your main freqs are in two different banks, you stand more of a chance of not missing most of the action. Or you can use two handhelds with two earphones, like I did! I don't like the priority feature that much, cuz the comm breaks up.

Other hints:

Bring those scanners on vacation this summer. I usually program the marine freqs when we go to the Cape. We go on a whale watch, so it's fun to hear the captains' banter. Staying near Otis Air base, so mabye I'll tune in the military air. Last year I brought the BC200 instead of the PRO43. What a bummer when I found out there was an air show at Otis the weekend I was there! Missed the Snow Birds' comm. This time I'll bring both!

This is my wife's account. Please respont to: tron@elderhostel.org

These are emergency tones to wake the firefighters up if they are asleep
and some are used to activate pagers and radios. They are also helpful
to scanner listeners and volunteer firefighters since when you here the
tones, you know some sort of emergency is about to be dispatched. My
oldest brother was a volunteer firefighter for several years and I
remember being at his house several times and hearing the emergency
tones going off on his scanner and he would have to go on the emergency
run.

An interesting tone that I've heard is the Delaware County (just north
of Columbus, Ohio) fire dispatch. Their emergency tone is the DTMF
sequence 9-1-1.

Try removing the back and looking at the solder joint on the antenna lead,
I have had a
few Radio Shack scanners that had bad solder joints there, the wire is not
flexable
and sometime break this joint, to repair it I use a more flexable wire and
then, make
a half loop in it to take the stress off the solder joint, then solder it
back.

I have a PRO-62 and I love it. Never any problems with it. Its got great sensitivity and triple coversion. I did have some problems with intermod in the urban areas around Baltimore connected with RS Mag Mount scanner antenna on the VHF-hi band. Other than that I give it a 9.5 outta 10. And, no it is not modifiable. For a new one maybe $179.00, but that's a guess. I do know that Radio Shack has discontinued them.

Cellular Telephones are full duplex. This means only one side of the
conversation is supposed to be on one frequency. However, in real
life the cellular providers equipment can have bleed-through
(intentional or not.. mainly at the 2-to-4-wire hybrid interface to
the landline telephone system), and the cellular phones themselves
have "sidetone" which sometimes comes through at low level so you can
hear some of both sides.

When it all works perfectly, you SHOULD only hear one side to my
understanding.

> Any info would be appreciated.

From the FAQ article REPAIR TIPS: RADIO SHACK SCANNER RADIOS:

[...]

GRE-Built Base Models: Dim Backlight

The backlight in many base models, including the PRO-2022,
PRO-2004, and PRO-2005/6 is implemented by an
electroluminescent panel, which grows dim with use.

The EL panel used in the PRO-2005 and PRO-2006 is
designated EL-501, and is identified by Radio Shack part
#10800050. A new EL panel can be ordered through your
Tandy National parts (see above) or local Radio Shack store
and sent to your home. Radio Shack no longer sells
replacement EL panels for the PRO-2004.

Replacing the backlight is an operation which requires care
and patience. The service manual has an exploded parts
diagram which is helpful in showing how to disassemble the
scanner.

[...]

USB = Upper Side-Band LSB=Lower Side-Band
Collectively they are referred to as Single Side-Band(SSB). This mode of transmit/receive is frequently used on HF(below 30Mhz) and by amateur radio throughout the VHF/UHF bands. This mode is typically found on higher-end(i.e. $$$$) units.

TV and typical FM radio or WFM. For TV signals, check out the Oakland FAF on my main radio page.

> I read a lot of your pages. I appreciate the great info, thanks.

You are quite welcome. Glad you found them useful.

> What is double/triple conversion? Is it filtering of static?
> I saw from your sig that you live in NC. Do you know if suburban
> states like NJ also have a lot to listen to?

The conversion scheme is used to "tune" the received frequency to one which can be "heard" by the scanner itself. Double conversion is a two-step "process" by which this is accomplished. Triple conversion is three steps and helps to eliminate frequency images which are a by-product of the receive process. Such frequency images manifest themselves as "false" signals which are heard on frequencies they should not. For better understanding, check out the info on super-heterodyne receivers in Police Call Plus.

Anywhere in the NJ/NYC is jammed packed full of signals. I use to live in Poughkeepsie, NY which is 70 miles north of NYC and could hear all sorts of stuff from there. Between the power of the signals and the ducting along the Hudson River, it made for interesting listening. You should more to listen to than you can handle. One of the Scanner Master Books is aimed at this region I believe.

> What are trunk radios? Am I right in thinking its a special radio that
> picks up "Trunked Systems" which change frequency for the privacy of
> the user? How common are trunked systems (if I get a scanner that
> can't pick up trunked systems, will there still be a lot to hear)?

You are essentially correct. See my New User FAQ for more details on Trunked Systems. They are essentially multi-frequency computer-controlled

systems which means broadcasts "hop" around on different physical frequencies making conversations difficult or near impossible to follow. The new TrunkTracker from Uniden follows the computer control allowing it to switch to the proper physical frequency just like the real transmitting radios do so that you can follow conversations.

There are a lot of trunked systems, and only some of them can be followed by the TrunkTracker. It can not follow systems in the 400 or 900MHz ranges nor can it track Ericson/GE systems...only Motorola analog. While an important piece of the spectrum, there is a LOT to hear outside the 800MHz ranges.

> Am I correct in thinking that a scanner is only for recieving, not
> broadcasting as well?

That is correct. You need a radio license to transmit and then only within restricted bands is allowed.

> What kind of models would you recommend for a beginner, looking for a
> decently easy to use scanner, looking for a handheld model that can
> pick up the "exciting stuff", at a price range of around 150-250
> dollars? <--- sorry for the newbie question :-)

For this price range, the new RELM HS200 is a wonderful gem running around $230 these days. A little more will get you a new BC235XLT TrunkTracker if that interests you.

"Scanners" are quite legal in the UK with no "restrictions" on the frequency coverage.

If you are after some frequenmcies or where to look for certain types of activity take a look at http://www.termcon.demon.co.uk/ and our web page has a recent updated list of VHF/UHF airband information.

Enjoy your trip.

Clough@javiaton.demon.co.uk "Jonathan Clough" writes:

> Just take one screw out from each side - the one of the "front" half of the
> case.

Ah Ha !

It doesn't matter which "half" you go for but you don't have to take all
four small black screws out - its better if you don't - just one from
each side of *either* the front or the back half.

As Mike said it s considerably easier than it sounds !

Jeff

I did a similar routine for last weekends shows at NAS Willow Grove
and Gabreski Airport.

For the Blue Angels I placed all their reported frequencies together.
Then when their show was beginning I turned off the other banks.

Speaking as a former controller I offer another tidbit. Arrive early
and monitor the tower frequencies. Even shows that are spread over a
couple of days will have stragglers coming in late. Very often they
won't have the frequency card for the show. Listen carefully for
instructions from the tower advising them to contact the AIRBOSS on
"xxx.xxx".

Also, don't leave out Guard frequencies of 121.5 and 243.0.
Unfortunately this was proven again with the crash Sunday at Gabreski.

I had always heard that mobiles operated on a different frequency so
that an open mike (by accident or design) on the cab side wouldn't
keep dispatch from broadcasting calls to the other mobiles in the
field.

In other words, a stuck mike in a cab might keep dispatch from hearing
the mobile units, but it wouldn't keep the cabs from hearing dispatch.

From the company's perspective, dispatch is where the money is.

IDK the legality of it, but I would presume that since it's not illegal
to own a scanner in the UK, it wouldn't be to bring one in. For the
record - I have brought a US scanner (an ancient Pro-57 circa 1988) into
the UK with no probs.

Jim,
I have found Probe to be far superior and more flexible for my
particular needs. Granted, it doesn't come with the fancy Windoze
interface, but for me that's just fine 'n dandy! There are some
nice features in the other packages I have tried but I found
Probe to have the best set of usable and productive features by
far.
Good luck!

Hi Bryan,
My personal belief is that the 50 channels, 2-second
delay and double-conversion is awful limiting. If you
were to just use it casually in an area with low
activity then it might suit you.
If in a strong RF environment, you'll have problems
with images and intermod. You mentioned the problem
with 2-second delay on trunked systems. And larger
urban areas have lots more than 50 good frequencies
unless you are a fanatic of only one or two agencies.
It seems your posting was more negative than not, so
I'm wondering if you've already made up your mind. Granted,
this radio would be better than nothing and it comes at a
good price. Is this the limit of your budget or do you
feel this deal is just too good to pass up?
Your other possiblities include the BCT-7, BC760
and Pro-2046 and there's always the used stuff like
the Pro-2026. These won't get you away from the double-
conversion problems but they will give you more channels,
and no forced delay while remaining respectably fast.
Good luck in your decision!

Plenty. Check out my web page below. Click on
Radio Monitoring link. Find my list of receivers.
You'll find pages and my reviews for both of
these radios.
Unless you are obsessed with having a very
small receiver, ensuring you have few problems
with intermod or must have computer control, I'd
suggest going with the 9000.
Either way, happy reading and good luck!

Source record: 193314

This morning, between 1027 and 1037 PDT, I could clearly hear the MIR spacecraft on 143.625 MHz as it passed over the Southern California area. The signal was strong, even with an omnidirectional antenna, although there was fading that is indicative of some spin on the spacecraft. It sounds like they are using a full duplex circuit so you can hear BOTH sides of the conversation on that frequency. Of course it would help if you can speak Russian.

Next pass over SoCal is 1203-1212 PDT.

The Bote Man <me@noplace.special> wrote:
> ... Motorola uses F.C.C. channel number designators and this
> is a fixed and unchanging set. I'm curious what the truth is.

Actually, there are two sets of frequencies corresponding to the FCC channel numbers. In the US/Mexico border area, channels are offset from the frequencies used elsewhere. If you're programming a trunk component in San Diego or El Paso, you'd better be sure the radio knows it's not in Philadelphia. There are also proposals in the US and EU to reduce the bandwidth, so in a couple of years there may be another 600 channels in the 851-866 MHz band (866-869 is already at 12.5 kHz).

Based on the discussions to date, I'd guess (and this is just a WAG) that the TrunkTracker, upon recognising a desired OSW, does a quick scan of the programmed channels looking for the hand-shake. This would skip the need to translate channel number to freq., take care of border-area offsets, and yield a radio that would work in areas not subject to the FCC's dicta. I don't know the internals of the various systems, but this might also help with inconsistancies between type I, II, IIi, etc systems.

Greg, without violating your oath of Omerta to Uniden, could you give a few details ?

Ahh, "General" NeXus - what was he supposed to do? Drive a 15 / 30 / 90 mile closed loop, and then call Garner back and tell 'em if it was stronger at a certain point? Using your logic, by that time "Langley" might have gotten the signal anyway. He should be congratulated for calling the local rescue and bringing it to their attention instead of ignoring it.

I sure hope that while you were a CAP "officer", you used your real name.

The fire departments use those tones to activate the FF's pagers and radios. With some cities being so large & the Fire Departments being diversified into having differnt equipment for differnt assignments. Each area of the city or each batallion/ station may have its own special tone. When dispatching units from station 1 to a vehicle accidnet. Only the FF's at station 1 need to hear the call, so the dispactch is preceeded by the tone for that station. You will hear alot of differnt tones, there may be differnt tones for every fire station in the city, for differnt types of calls (house fires, vehicle accidents, etc) and groups. For a 1st Alarm there may be tone that recieve only those calls and everyones pager or radio that is set to that tone will recieve the call.

5704. Great New Computer Interface!!

Newsgroup: rec.radio.scanner

From: wiggie@kansas.net
Message-ID: <33B2FD61.48DF@kansas.net>
Source record: 193330

NEW COMPUTER INTERFACE - AUTOPROGRAMMER - SUPPORTS MANY TYPES OF SCANNERS
I have been computer controlling my Pro-2035 scanner with the Optoelectronics OS535 board and Probe Software. This is just one incredible setup. For unattended scans I also use RECALL which is a voice-activated recorder with time-stamping. The time-stamping matches up with the log files that Probe kicks out. Sure it might not be as flexible as the VADER system, but at $15 it is alot more appealing, plus I dont think that the VADER recorded much more than 16megs...yes you could swap out some memory modules and get more but pay the $15 once and record as much as your harddrive/zip/jaz drive can hold. You can find RECALL at http://www.sagebrush.com/~sells/recall.htm.
Now many ppl have complained and said that you are unable to program the scanners internal memory with the Optoscan OS456 and OS535 boards...yes that is true. But, I was diligently working on a serial port interface that would program the 1000 channels (or more if you did the memory mods). I had the hardware down and was starting to work on the software support when something better came along. John Montalbano came out with a parallel-port design of the autoprogrammer and he has been working on the software to support it. In fact he has a very good working copy now. He now has been working on a serial port design that would only require a hole for a 1/8th inch jack, two IC's and a few wires. Now my design consisted of one or two more chips, but the cost was about $20. John Montalbano's design will run you about $12-15 for everything.
This autoprogrammer has great potential and when there is substantial amount of interest and ppl putting their great ideas into it, the design/software will even become even BETTER!!! This is great for the hobbiest, they can do all the wiring and also make their own software if they would want. They could even use QBasic if their hearts desired. Other ppl that are afraid of the soldering iron...there is hope on the horizon for you also. There are some plans in the makings to make it easier for installation that might only require ONE solder joint. The rest is SCREWDRIVER SKILLS and the ability to follow directions.
To get started on this adventure, you can go to http://www.dejanews.com and do a search on the word "programit". This will pull up a post by John Montalbano...get on the mailing list and get started. This autoprogrammer will support the Pro-2035/2042/2032/2004/2005/2006 and many others. It has the possibilities to support many other scanners. I hope to see your name on the mailing list.

Wiggie

The local police dept. recently added laptop computers to most of their patrol cars. They are utilizing software called "PacketCluster Patrol" designed and sold by Cerulean Technologies of Marlboro, Mass. There web page is http://www.cerulean.com

Does anyone have any ideas on decoding the packet transmissions from these laptop. Is this similar to Mobile Data Terminals (MDT)?

Any suggestions would be help...Thanks

Todd

I have found they use the same frequencies at the Vancouver race, but
cannot speak for Toronto. I would guess that they use the same, or their
alternate frequencies at each track.

I have a pretty good list of CART frequencies if that would help your
cause.

Could someome please send me info on what mods are available for the
BC 860xlt and the Pro-2034.

Can they be modified to receive cellular?

Is the BC 860 XLT basically the same as the BC 855 XLT?

Please reply,

Thank you
Garry

5711. Help.. Scanner selection..

Newsgroup: rec.radio.scanner
Date: 1997-06-26 00:00:00 UTC
From: RareBear@webtv.net
Message-ID: <5oveuv$309$1@newsd-199.bryant.webtv.net>
Source record: 193337

I have a friend who is interested in buying a scanner. I have been a bit out of touch with whats new and the current pricing, since I last bought a scanner (BC890 XLT) in '95.

He wants to spend around $200 and is undecided between a handheld or a Base/mobile.

For this price range he wants at least 100 channels, and the most complete coverage between 29-956 mhz (including the 108-136 and 225-406 am bands). that he can get. However he only wants to buy new..

I know the 890 that I have will do this, but which others? and what models of handhelds can accomplish this?

He is not stuck on Uniden and is willing to buy any quality brand that gives him what he wants..

Any help that anyone can give me is appreciated greatly.. thanks in advance.

Barry,
Here in the US, many police officers use the phonetic alphabet in a manner that would make CL (see el) pronounced as Charlie, L - Lincoln.

They sometimes say the letter AND the phonetic equivalent, for only SOME of the letters, not staying standard for the whole list, like C - Charlie, L - Lincoln, etc...

Hi,

I just got a Pro-60 myself after doing some research. I picked it mainly because of the frequency range that it covers. I also think that you got a very good deal with the warranty because when I went out to Radio Shack to buy my scanner they offered to sell me 6 months of warranty for $60 which I think is a total rip off.

Scott,
The only new radio that will get the mil aero band for around $200
is the Pro-60 which is on sale at Radio Shack for $200(it is being
discontinued). The Pro-60's normal price is $380.
Just above that would be your BC890XLT for around $235.
Normally, most new radios which have the mil aero band, regardless
of whether it is base or handheld, will cost well over $300. These
include the BC9000($360), BC3000($340), Pro-2042($340), Pro-26($350),
AR3000($1000), AR5000($2000), AR8000($550), R10($500), and
R8500($2000).

As once again, PJB can't post unless it is to post something negitive about Bill Cheek. Can you prove one that it was illegal.Why is it you never have anything to say about anything else. I also don't see you crusading on anyother newsgroups about the spam. I haven't seen you start an organization against doing business on the internet. Why must you post a negitive article or three for every one of Bill's or anybody who posts one about Bill.

Read the newsletter first. OR better yet shut up. Also ask you doctor why you have such a fixation on Bill Cheek.

Source record: 193110

OK, I cobbled up the beginnings of a frequently asked question list containing mostly definitions of terms so that we can communicate more effectively about trunked systems and receivers designed to hear them.

If you have updates or corrections, they are desired, but my time will be non-existent for several weeks beginning next week, so gimme time to implement them. Thanx!

With a decent outdoor antenna (a 6-meter ham antenna), and depending
on the type of cordless phone, the 49MHz variety can be intercepted up to
a mile away in a semi-rural area. In a more congested area, there tends
to be multiple signals on each channel and a higher ambient electrical
noise level. It is harder to get that kind of range. A beam antenna
could help.

5740. How can I get trunks???

Newsgroup: rec.radio.scanner
Date: 1997-06-27 00:00:00 UTC
From: "Ian F. Fritzsche" <abc@rose.net>
Message-ID: <33B49E0F.1D79@rose.net>
Source record: 193112

Hi there and thanks for reading this. I am interested in listening to
local emergency
frequencies, but all of our local public servics stuff (Fire, EMS,
Police, etc..) has
moved to a 800MHz Motarola trunked system. Police call plus lists the
frequencies
(output) as: 854.9875,855.9875,856.9875,857.9875, and 858.9875. Today I
talked to a
friend of mine you works in the city's EMS and has one of the trunking
radios. He said
that the trunk was SIX frequencies, not the listed FIVE, and that each
one of those
trunks acctually had 45 possible frequencies that a radio in in the trunk
could use. He
said that not only would I have to monitor all 45 channels just to hear
the calls on ONE
of the trunks, but also that the frequencies were "splintered" so instead
of just a
standard frequency like 888.345, they might use 888.34759835 and that my
scanner (that I
havn't bought yet) won't be able to hear this. THIS I doubt, but I don't
know. Could
anybody who has had experience listening to these systems give me some
info please??
Thanks!

I'm sorry Victor, I have tried the link on three different servers and were able to get through. I also have about 10 e-mails thanking me for the link and have been enjoying the program. Unless they were all trying to pull my leg, I take it as though the link works. You might try it again but make sure if you copy/paste that you delete the "." at the end of the paste.

Cross-posted to: rec.radio.scanner,alt.radio.scanner

Thanks to my friend Marshall at a local Radio Shack, I
have been updated on their latest two scanner offerings.
The first is the Pro-67 handheld which is a 200 channel
triple conversion unit with service search and search-skip.
The footprint is identical to the Pro-26. Button layout has
changed as has the speaker grill but that's about it. With
the fast speed, service search and ten priority limits, I
would guess this is another Uniden job. Seems to be a cross
between a replacement for the Pro-51 and Pro-62.
I picked one up and hope to have a review in the near
future. See my web pages for a few other tidbits thus far.
The other new radio is the Pro-2041. Don't know much about
it. Might be able to get more info this weekend. Similar
looking to the Pro-2039. 400 channels, triple conversion and
wide coverage but mil aero is definitely missing.
I also have a few items added to my User Opinions page that
some might want to check out. These include a computer
controlled 2035, an amplified antenna from C. Crane Company
and a nice review of the new Yaesu VX-1R. Thanks to those who
gave of their time to make these submissions for our benefit!
Happy reading and good weekend monitoring!

Strong signals,

Subject: Money4U

Greetings,

Hopefully my name is still on the list below. I am a retired attorney, and about two years ago a man came to me with a letter. The letter he brought me is basically the same as the letter in front of you now. He asked me to verify the fact that this letter was legal. I told him that I would review it and get back to him. When I first read the letter I thought it was some off-the-wall idea to make money. A week later I met again with my client to discuss the issue. I told him that the letter originally brought to me was not 100% legal. My client asked me to alter the letter to make it 100% legal. I advised him to make a small change in the letter and it would be alright.

I was curious about the letter, so he told me how it works. I thought it was a long shot, so I decided against participating. Before my client left, I asked him to keep me updated as to his results. About two months later he called to tell me that he had received over $800,000 in cash! I didn't believe him so he asked me to try the plan and see for myself. I thought about it for a couple of days and decided that there was not much to lose. I followed the instructions exactly and mailed out 200 letters. Sure enough, the money started coming! It came slowly at first, but after three weeks I was getting more than I could open in a day. After about three months the money stopped coming. I kept a pecise record of my earnings and at the end it totaled $868,439.00.

I was earning a good living as a lawyer, but as anyone in the legal profession will tell you, there is a lot of stress that comes with the job. I told myself if things worked out I would retire from practice and play golf. I decided to try the letter again, but this time I sent 500 letters out. Well, three months later I had totaled $2,344,178.00!!! I just couldn't believe it. I met my old client for lunch to find out how this exactly works. He told me that there were a few similar letters going around. What made this one different is the fact that there are six names on the letter, not five like most others. That fact alone resulted in far more returns. The other factor was the advice I gave him in making sure the whole thing was perfectly legal, since no one wants to risk doing anything illegal.

I bet by now you are curious about what little change I told him to make. Well, if you send a letter like this out, to be legal, you must sell
something if you expect to receive a dollar. I told him that anyone sending a dollar out must receive something in return. So when you send a dollar to each of the six names on the list, you must include a slip of paper saying, "Please put me on your mailing list" and include you name and mailing address. Your phone # is optional). This is the key to the program! The item you will receive for a dollar you send to the
six names below, is this letter and the right to earn thousands. We will be working together to improve each others lives!

Follow the simple instructions below exactly, and in less than three months you will receive over $800,000.00 GUARANTEED!!!!!!
A) Immediately send $1.00 to each of the six people on the list below. Wrap the dollar in a note saying "Please add me to your mailing list" and include your name and mailing address (Your phone # is optional):

1) Chuck Lane 7709 N. Pecos St. Denver, CO 80221
2) Steven L. Colbert 3705 W Northgate #306 Irving, Texas 75062
3) M. Darrah 12414 SE 4th Place, Bellevue, WA. 98005
4) JP DZAHR PO Box 5562 Bellevue, WA. 98006
5) Dan Conway 12520 E. Calle Tatita Tucson, AZ. 85749
6) Eric Heale 46 Tingkat Nibong Satu Bayan Baru. 11950 Penang MALAYSIA

B) Remove the name next to #1 on the list and move the rest of the names up one position. Then place your name in the #6 spot. This is best done by
typing a new list and taping or gluing it over the old one. Or by saving this to a text file and editing it yourself and saving the new edited copy.

C) When you have completed the above instructions, you have an option of mailing your new letter out in two ways: 1) Through the U.S. Postal Service or 2) through e-mail. This letter has been proven perfectly legal
for both ways as long as you follow the above instructions. To mail this out over the internet, you can browse through areas and find people to send this to all the time. Or you can get a Mass Mail Network to mail it
out in large volumes for you. Either way will bring big payoffs. If you are going to use the traditional U.S. Postal Service to do this program, you will want to order 200 names from a mailing list company. Two that have been most effective for these list are:
(Be sure to ask for "Opportunity Seekers" labels)

S.E. Ring Mailing List ($39 / 300)
P.O Box 15061
Ft. Lauderdale, FL 33318 (954) 742-9519

Advon Distributors ($28 / 200)
P.O. Box B-11

Shelly, ID 83274 (800) 992-3866

D) When your mailing list arrives, place one label on a stamped envelope and drop them in the mail box (Be sure to send out 200). Within 90 days, you will receive over $800,000.

E) Keep a copy of this letter so you can use it next time. Mail it out again in about 6 months. But mail it to the addresses you received with each dollar. It will work again, only much better.

THIS IS A SERVICE AND IS 100% LEGAL !
(Refer to title 18, Section 1302 & 1342 of the U.S. Postal and Lottery Laws)

Assume for example you get a 7.5% return rate, which is very conservative.
My first attempt was about 9.5% and my second time was over 11%.

1) When you mail out 200 letters, 15 people will send you $1.00.
2) Those 15 mail out 200 letters, and 225 people will send you $1.00
3) Those 225 mail out 200 letters, and 3,375 people will send you $1.00
4) Those 3,375 mail out 200 letters, and 50,625 people will send you $1.00
5) Those 50,625 mail out 200 letters, and 759,375 people will send you $1.00
At this point your name drops off the list,
but so far you have received $813,615.00!!!!!

It works every time, but how well depends on how many letters you send out.In the example above, you mail out 200 letters, if you mailed out 500
letters, you would have received $2,006,917!! Check the math yourself, I want you to, but I guarantee it is correct! With this kind of return, you've got to try it. Try it once and you will do it again!!!

Just make sure you send a dollar to each of the six names on the list with
a note to be added to their mailing list. Together we will all prosper!!!!
GOD BLESS !!!

What LED is dim? The sound squelch LED? That is the only LED on the
PRO-2006 that I can remember. Perhaps you mean that the display backlight
is dim. If that is the case you need to go to Radio Shack and order a new
backlight assembly. They should know what you are talking about, after all
they have answers. Its not too hard to replace if you are handy with small
tools and a soldering iron.

I was wondering if the CART teams use the same frequencies I have seen posted on the net, in Canada? I have only done a quick ckeck of frequencies but I have found that one freq assigned to Paul Tracy is licenced in the Toronto area to Clearnet (a PCS provider). Do the teams have to change all their radios? Am I out of luck with the freqs on the net?

Please do not suggest finding the Frequency Fan Club trailer and buying a current lit. The last two years that I have been at the Molson Indy Toronto I have not seen anything like it.

I believe they also simulcast their dispatch on 155.880. It's either
Westerville or Worthington who use this freq. I think sometimes both
departments use the VHF high freq.

5759. FS: Yaesu FT-50 RD package

Newsgroup: rec.radio.scanner
Date: 1997-06-27 00:00:00 UTC
From: dconti@carroll.com
Message-ID: <ECF4Aq.CCJ@nonexistent.com>
Source record: 193454
Cross-posted to: rec.radio.swap,rec.radio.scanner,alt.radio.scanner,rec.radio.amateur.misc,rec.radio.amateur.equipment

I have the following Yaesu FT-50 RD hand held dual band package for sale :

FT 50-RD HT with FNB 41 battery, paid $339.95 new, COMET SMA 3 antenna, paid $34.95 new, FNB-41 battery paid $58.95 new, FNB 40 battery paid $48.95 new, MH 34 lapel speaker Mike, $30.95 new. These items were purchased on 5/10/97.

ADMS - 1C software and cable, $36.95 new, CA-14 NC-50 charger adaptor set, $24.95, NC-50 dual sequential rapid charger, $99.95 new. These items were purhcased on 5/15/97.

CSC-68 soft case for FT-50 RD, $15.99, E-DC-5B cig. lighter adaptor plug, $24.95.

All items are MINT, and as if brand new. Receipts will be provided for all above. My total cost of package - $716.00

Will sell for $500.00 shipped to 48, COD $5.00 extra.

Will not break up package, NO TRADES.

Source record: 193455

When you run MDTSTUFF.EXE the computer will do nothing onscreen until it receives a signal and converts it to a screen image. Only then will the screen come alive with MDT data. The data.dat file will be empty unless some MDT traffic is actually decoded and then will have the decoded traffic in the file to allow later reading. Remember to save the file with a different name or on a different disk to avoid having it overwritten the next time you run the program.

In article <33A421DB.19D@earthlink.net>, tony <al149@earthlink.net> wrote:

>out noise, but I'm not sure if I'm correct)

CTCSS is a way for two users to share the same frequency without
hearing each other. It's like a secret knock to a clubhouse: each
radio generates a signal that cannot be heard (sub-audible is the term
for it) but is received by the other radio. If the correct tone
(knock) is not heard, the radio doesn't "let the signal in."

>70 miles? Wow that's a pretty big range! Do you know what kind of
>range the BC235XLT has?
>

Range depends upon your elevation, antenna type, if there are any
sources of interference around (computers, flourescent lights, nearby
radio station towers).

>Can trunked scanner also pick up normal frequencies?

Yes, the trunk-tracker radios can pick up "normal" frequencies.

>>There are a lot of trunked systems, and only some of them can be
>>followed by the TrunkTracker. It can not follow systems in the 400
>>or 900MHz ranges nor can it track Ericson/GE systems...only
>>Motorola analog. While an important piece of the spectrum, there is
>>a LOT to hear outside the 800MHz ranges.
>
> What's Motorola "analog"?

This refers to a Motorola system that is broadcast in "analog" mode,
not digital. In analog mode, the actual sound being transmitted is
transmitted (like a FM radio station) and a digital signal is sent as
a series of 1's and 0's. Digital signals sound like a hiss on your
scanner.

>>For this price range, the new RELM HS200 is a wonderful gem running

>a tape recorder? Does it have jack where I can hook up another
>anntena?

The price range seems to be $250-290. That seems like a decent price.
It has a headphone jack that you can plug either headphones or a tape
recorder into, although if you plug something into this jack it
disconnects the speaker in the scanner, so the tape recorder should
have a play-through mode so you can listen to the scanner while it is
recording.

>Do you know if most FBI and U.S Secret Service frequencies are

>profile agencies. If it the type of deal where everything is encrypted
>and civilians cannot hear anything exciting for those particular
>agencies? Or is it the type of atmosphere where it's more casual since
>only a small % of the civilian population own scanners?

No, most of the Federal agencies are going to encrypted systems, since
the number of scanner owners is increasing everyday, and they REALLY,
REALLY don't want anyone listening anyway.

>When I see a frequency 123.4567 does that mean ~123.4 hertz or
>1,234,567 hertz?

When you see a frequency somewhere in the format 123.4567 that is in
Mega Hertz. That is how you put it into your scanner.

You can program the radio for convention operation, but not for
trunked service.

No, you cannot create a dummy system key. Nor can you download the key
from an active radio - you need to use the system key disc that is supplied
by Motorola to the purchaser of the system.

Ok so far 2 people have given me model #'s for the Montgomery Ward 18 ch base/mobile scanner made by Bearcat. They are BC 211 and BC 210 XL ?
Q is there any way to get a positive id on the scanner ?
If i remember right back when the 210 XL came out it had a blue readout ?
Where as my scanner has red readout. Anyone know if there are any tricks to teach this old scanner ?

Thanks

>for the cellular hardware key, which seem to connect to the micro
>processor.
>
>

When I contacted Opto about a year ago, I got hold of some techie that said the daughter board specs were available to 3rd party companies for development. When I called back, requesting info on becoming an approved 3rd party, I was told "...Oh no. There is no such plan. There are no specs. There are no future plans for these spots, and the guy you talked to earlier doesn't know what he's talking about..." - yeah right.

Does anybody have the dates (or codes) to tell the 3 versions of this product apart?
Has any of the programming changed?

5766. Mail order question

Newsgroup: rec.radio.scanner
Date: 1997-06-27 00:00:00 UTC
From: YDK <bigtommy@ix.netcom.com>
Message-ID: <01bc829b$332a8e60$27c2b8cd@ydk>
Source record: 193461

Here's something that's rare to ask:

Say I make an order at a <whatever> mail order company for a scanner.
Fine. I get the order after a few days, but what I get is not what
I ordered. As a matter of fact, its the model better than what I got.
To make things more complicated, the receipt specifies the model I
wanted, not the model sent to me.

With this in mind, am I:

o Obligated to call to get what I originally ordered
(consequence: more time to wait for product, and possibly have
to pay for shipping of the wrong product)

o Keep what I have because its that mail order company's fault
(consequence: guilty conscience, and company's loss of profit/s)

What should I do? Does this company have tracking for what goes out
(assuming its a big company)? What legal rights do I have?

I've had bad experiences with mail order, and I am considering on
buying a new scanner, and other unrelated stuff.

Any advise is appreciated!

Tommy

What is a "frequency "image"? So 2/3 conversions allow the radio to
skip frequencies with noise? Are these 2/3 conversions "CTCSS"? If
not, what is CTSS? (as far as I could understand it's a way to filter
out noise, but I'm not sure if I'm correct)

>Anywhere in the NJ/NYC is jammed packed full of signals. I use to

What's Motorola "analog"?

>For this price range, the new RELM HS200 is a wonderful gem running
>around $230 these days. A little more will get you a new BC235XLT
>TrunkTracker if that interests you.

I took a look at the specs for BC235XLT and it looks like a great scanner. It has a lot of banks,channels, triple-conversion, can handle trunked systems, and lot of other features that look great. The lowest price I found was 270 dollars. Would you say that's a pretty good price for this model? Do you know if it has a jack where I can plug in a tape recorder? Does it have jack where I can hook up another anntena?

Do you know if most FBI and U.S Secret Service frequencies are encrypted? I'm curious about the atmosphere surrounding these higher profile agencies. If it the type of deal where everything is encrypted and civilians cannot hear anything exciting for those particular agencies? Or is it the type of atmosphere where it's more casual since only a small % of the civilian population own scanners?

When I see a frequency 123.4567 does that mean ~123.4 hertz or 1,234,567 hertz?

what's VFO?

Appreciate the advice...

You may also wish to listen to Metro Police's trunked frequencies. The last time a member of the Royal Family visited, Metro lent a bunch of portables to the Queen's Cowboys. Listen for any tactical callsign with an X in front of it, and those will be the mounties. You may also wish to listen to the Canadian government 900 MHz trunking system.

Hopes this helps...

Dear Friend - Thank you for your interest in our advert.
We are going to market valuable information to Internet Users by post. To reach as many people
as possible, we have to make use of agents. We would like you to work for us as an agent, distributing this information to the public on our behalf from your home. You will be supplied with
the addresses of various people, the information to send to them as well as an attached letter and you will receive $10. This will be your payment.

On average you will send out 500 letters every month with a response of about 60%. This will be an
earnings of $3000 in your pocket. If you want to be really pessimistic and expect a response of a
mere 30%, you will earn $1500 for that month. The envelopes and stamps are provided, and so is
the material which you must send, so expenses are minimal and you receive an extra $1000 or so in
your pocket every month! for simply filling and posting envelopes. Your working time will be under
two hours per day, and remember you work from home, therefore you are your own boss and YOU decide when you work. You will keep in regular contact with us.

To be appointed as one of our agents, we ask you to send us a small registration fee of $15.00
(or equivalent) in the form of cash. Please enclose a Self Addressed Stamped Envelope with your registration fee. Upon paying this fee, you will be appointed an agent and recive the information you are to post to the public, as well as your instructions and all other necessary
information.

Please complete the application form and supply us with a business name under
which you would like to trade.

Yours sincerely,
The Manager

I have one and it works fine. It is pretty rugged, GRE made and takes a
beating (drops, bangs, etc) well. I went ahead and purchased the
extended
warranty for 3 years. But I suppose since they have been discontinued
now
you must be buying one used or have found a RS that has one left.

The audio output is VERY good for a hand-held. This is typical of GRE
made
stuff. I hook a external spkr and it get's even better!

No mods that I am aware of.

If you have the money I would go for the Pro-60 instead. I wanted to at
the
time (2 years ago) but it was too expensive for me.

I have found quite a few of these "new channels" in my area it was
going quite dead around here for about the last 6 months or since last
xmass. and I went to best buy to look at a 20 channel lowband handheld
for specs and sure enough the channela 01 to 16 are the 43.xx freqs anow
I tuned em in and wham tons more to listen to...i live by a 500 unit
apartment complx its 2 blocks away but I have a discone antannae that

picks it all up really well....

I cant speak for your concious, but I would call the mail order company,
and either offer to send them the difference (If I decided I wanted to keep
the better, but wrong order), or tell them to send me the correct order,
and
then have the UPS guy pick up the return of the wrong order when he
delivers the correct order, at the companies return expense.
I would in no way hesitate to use the equipment
until the correct equipment arrived either, if we were talking more than
next day air. Some companies will just tell you to keep the better one,
and in fact, may have run out of what you ordered and sent a better one
on purpose (some advertise this).

If in doubt, just buy from reputable people, such as Jeff with The Ham
Store.

Dave

5785. Old RS/BC schematics?

Newsgroup: rec.radio.scanner
Date: 1997-06-27 00:00:00 UTC
From: jgurley@cdsnet.net
Message-ID: <5p0kn6$h9k$1@news.cdsnet.net>
Source record: 193480

I've got an old CRYTAL controlled Radio Shack scanner Pro-26 (I know the model number is pretty confusing!). Anyway, it was broken by a previous owner (I think they plugged it into 12v - instead of 6v), and I'm trying to debug it.

I'm stymied by lack of information about the GRE T3375 componet, which is obviously related to the scanning mechanism. Does anyone have a schematic for ANY older crytal units which they could either send me a jpg/gif or FAX me the area of the schematic showing this part?

Thanks in advance!!

5786. Scanner Modification: Data/Tone Squelch

Newsgroup: rec.radio.scanner

```
================================================
A TIME-HONORED MODIFICATION FOR
PRO-2004, PRO-2005, PRO-2006, PRO-2035, PRO-2042
================================================

Updated - more effective than ever.

MOD-44B DATA/TONE SQUELCH

Lets scanner resume SCAN or SEARCH after stopping on continuous tones,
computer data, and many other non-voice signals. Scan/Search stops
are only momentary. Resume is automatic! Yet, indefinitely pauses for
voice signals as it should! Works with and similar to the factory
Sound Squelch function, except just the opposite.

Scanners Supported: PRO-2004/5/6 and PRO-2035/2042
(others not supported at this time)

Complexity: Medium Easy. 2 ICs, 1 trimmer, several diodes,
resistors, and capacitors. 5 connections to scanner,
with one wire cut and two splices.

AVAILABILITY: (presented in the WORLD SCANNER REPORT, V5N10)
or as:
1. Instruction Set Only:
2. Kit of Essential Parts plus (1) above:
3. Kit, same as #2 with a precut/sized perfboard:
4. Kit, same as #2 with a printed circuit board:
5. Same as (4), but assembled & tested. U-install:
6. Same as (5), but we install & provide misc parts:

NOTE: Instruction Sets run 6-8 pages and are very detailed with
parts lists, diagrams, schematics, and step-by-step guidance.
Items 2-5 do not include switches, IC sockets, LEDs, or aesthetic
items. An SPST switch is needed to turn the Data/Tone Squelch on
and off. Switches and other personal taste items must be supplied
by customer, although we do provide a basic toggle switch on rear
of scanner for Item 6. The Data/Tone Squelch is extensively
field tested; time honored; and tested - a quality modification.

Hiya there Redhead!

What kind of traffic do you hear on 154.8? I live in Troy but don't often hear much on it.

Also, what kind of frequencies do you have for Troy? I'm mainly a listener of the FD when they have things going on, but as we speak I'm listening to the PD. I've got a listing of frequencies and what their channel is and who uses it if you'd like it. Let me know via e-mail.

Scott

5788. Computer Interface for Scanners

Newsgroup: rec.radio.scanner
Date: 1997-06-27 00:00:00 UTC
From: bcheek@san.rr.com
Message-ID: <33b4e665.92338251@news-server>
Source record: 193483
Cross-posted to: rec.radio.scanner,alt.radio.scanner,rec.radio.cb,rec.radio.amateur

```
MOD-57B: CE-232 SCANNER/COMPUTER INTERFACE
==========================================

AutoPrograms scanner's memory from a plain ASCII text file; AutoLogs
data; AutoRejects undesired signals; displays scanner data, automates
the operation of a complex scanning project; and does so much more
that you must see the special file for the CE-232 (CE232INF.TXT)
available from our FTP and Web sites.

Incidentally, the PerCon FCC Databases on CD-ROM can prepare the text
files ready to AutoProgram into the CE-232! Reid Drummond's APFTools
and C.A.T's MAGIC also prepare AutoProgrammer files for the CE-232.

Scanners Supported: Primarily PRO-2004/5/6, but performs at lesser
capability on PRO-2035/2042, PRO-2022/2021; PRO-34/37/39/43; and
others. We can develop a special software module to include many
other scanners. Handheld scanners require special techniques because
of limited space in which to install modifications. The CE-232
definitely interfaces to handhelds, though, and we have special
instruction sets for all scanners that we support.

Complexity: Heavy. 8 ICs, 8 diodes; handful of resistors and
capacitors. 19 or more connections to scanner.

AVAILABILITY (presented in ULTIMATE SCANNER book) or as:

1. Instruction Manual Only
2. Kit of PCB, essential parts plus (1) above
3. Same as (2), but assembled & tested. U-install
4. Same as (3), but we install & provide misc parts

5. 3rd Party Software Developer's Information Kit
(FREE download from our FTP and Web Sites)

NOTE: Instruction Manual runs 100 pages and is very detailed with
parts lists, diagrams, schematics, and step-by-step guidance.
Items 2-3 do not include switches, IC sockets, LEDs, or aesthetic
items. The CE-232 is extensively field tested; time-honored; and
tested - a quality mod.

For more information on the CE-232 Scanner/Computer Interface:

F O R S A L E

MARACOM M5100 VHF Marine Transceiver ----
5 and 25 watt transmit on marine frequencies.
Receives 9 NOAA weather channels, transmits
on channels 01-28 and 65-88. Digital readout.
About 7" wide, 2.25" high, 7"deep. White case
with black faceplate. Includes microphone, no
mounting hardware. Only $ 60 + shipping in US.

MOTOROLA MTX9000 fm handi-talkie radio,
model H01WCF4DB5AN NX type WCMA.
900mHz range. With charger and info.
Only $499.

COAX CABLE ---- heavy-duty, 1cm diameter, black plastic
covering, with foam dielectric. New, was on wooden spool
until I unwound it to get approximate length of 300 + feet.
No marking on cable; spool label says 1GHz. Was left
after cable TV upgrade, so probably 75 ohm. $20 + ship.

------------------ F L A S H L I G H T S ---------------------

4-D cell (2x2 style), krypton bulb. In box, never used.
$5 + shipping.

6-D cell multifunction lantern. Sleek tubular style with
bright incandescent light at end, 6W fluorescent bulb
along bottom, and flashing red and yellow on top. Also
has electronic sonic alarm that can be switched on with
the flashing lights. In box, never used. $12 + shipping

3-C cell Eveready worklight-style. Bright yellow with
hook for hanging, frosted bulb to diffuse light over area.
Unused, but no box. $5 + shipping

Batteries NOT included.....

COCA-COLA caps. Red cloth, white lettering. New.
$8 each + shipping. Only 9 available.

.... FOR YOUR DRIVING PLEASURE ....
1929 Mercedes SSK kitcar on VW chassis. Just completed, never titled.
Yellow, with brown fenders and running board, tan convertible top, side
curtains, and tonneau cover. Gold trim instruments.

COBRA 18-ULTRA CB ---- 40 channel, pushbutton tuning, with 3
NOAA weather channels. Includes microphone, but no mounting

hardware. $ 35.

LEXMARK/IBM PORTABLE PRINTER 5183 ---- powered by rechargable battery or AC wall adaptor (included), this printer is only 11.5" x 3.5" x 2", and weighs about 2.5 pounds with battery in place. Using silent thermal print head, it will print on either thermal fax paper or on regular paper using the enclosed thermal transfer ribbons. Very quiet in operation, and because it runs on a battery, it is completely portable, for use with laptop computers anywhere. Includes parallel port cable. $89.
.

ANADEX WORD-SCRIBE PRINTER ---- heavy duty dot matrix printer. Multiple ports, but no literature so only parallel port in use now. Tractor or friction feed. Fast, good quality; 17-inch platten. $ 15
.
add shipping to all prices, only in US....
if interested, leave e-mail...

Hello. I was hoping one of you die hard scanner fans could help me out in my quest for operating instructions for the AOR AR1000xlt scanner. The original instruction sheet consisted of only a few 8�x11 pages, however, I believe the size grew to a slightly larger manual sized book as the scanner mutated into other names. Also, I am told that there was a book entitled "Guide to the AR1000" by Howard Bornstein which I am unable to find if anyone knows where I can get a copy I would appreciate the info. I have tried AOR JAPAN Web Page as well as the U.K. AOR site, but they have been little or no help in my endeavor.

Mutated models for this scanner would be:

AR1000
AR2000
TR-1200 by Trident
HSC-010 by Camnis

Thank you for any help you can be. Please respond via e-mail to:

smeade@ixc.net or smeade@dave-world.net

Hi there and thanks for reading this. I am interested in listening to local emergency
frequencies, but all of our local public servics stuff (Fire, EMS, Police, etc..) has
moved to a 800MHz Motarola trunked system. Police call plus lists the frequencies
(output) as: 854.9875,855.9875,856.9875,857.9875, and 858.9875. Today I talked to a
friend of mine you works in the city's EMS and has one of the trunking radios. He said
that the trunk was SIX frequencies, not the listed FIVE, and that each one of those
trunks acctually had 45 possible frequencies that a radio in in the trunk could use. He
said that not only would I have to monitor all 45 channels just to hear the calls on ONE
of the trunks, but also that the frequencies were "splintered" so instead of just a
standard frequency like 888.345, they might use 888.34759835 and that my scanner (that I
havn't bought yet) won't be able to hear this. THIS I doubt, but I don't know. Could
anybody who has had experience listening to these systems give me some info please??
Thanks!

5797. Help needed for RS2009

Newsgroup: rec.radio.scanner
Date: 1997-06-28 00:00:00 UTC
From: hirschj@vax2.concordia.ca
Message-ID: <28JUN199708533063@vax2.concordia.ca>
Source record: 193044

Turned the above named unit on and 2 seconds later the
flourescent screen went dead and there is no response. There
is still static coming from the speaker but there does not
appear to be any scanning activity. I changed the battery to
no avail. Anybody out there with similar problem that was
solved or anyone with an idea. If not, anyone need a paperweight?
I would appreciate any email at:

hirschj@vax2.concordia.ca

Thank you.

5799. Trunker.exe on a PIC

Newsgroup: rec.radio.scanner
Date: 1997-06-28 00:00:00 UTC
From: Carter Brock <cbrock@dialnet.net>
Message-ID: <01bc83cf$a3e9aac0$82fa41ce@cbrock.dialnet.net>
Source record: 193046

I have hacked the trunker.exe code to a Microchip 16C73 microcontroller. Input is a "digital level" control channel source - I use data slicer output from a trunked portable. Output is ASCII at 9600 baud. I have implemented a simple system monitor in VB5 using the standard Comm control. Any interest in this? To use with discriminator output one of the simple op amp convert circuits should work but I have not tried this.

Stopped into Radio Shack to gawk at the new base model
2041. Got my friend Marshall to let me copy over the juicy
stuff from the manual. For a look see at the specs and
features of this radio, point your browsers to

http://www.qsl.net/n2mca/PRO-2041.HTM

Kind of bland looking radio but it has some nice features.
I hope to order one Monday to give a test spin and see how
it measures up.
Be advised that this radio has only been available since
June 17 and most Radio Shack stores will not have it in stock
yet.
Hope everyone enjoys their weekend!

Strong signals,

> techies: maybe you could shed some light on why frequencies like this
> exist... did the FCC somewhere down the line authorize these freqs to
> effectively double the available bandwidth???)

A splinter frequency refers to those channels which are inserted
between existing channels of common bandwidth. For example, in the UHF
spectrum
a splinter channel of 464.5375 would fall between the standard
channels of 464.525 and 464.550 and very likely would be restricted
to low-power portable use, and probably narrow-band use also.
I didn't bother to look up the allocation for the above frequencies,
I'm lazy right now.

The standard channel assignments in T-band always fall on
the 4-digit KC steps, for example 494.8375 and 495.0125
are standard channel assignments, not splinters.

I guess if 2.5 KC bandwidth radios become common, then current
splinter channels will be considered standard and they can
subdivide it again to get more splinter channels. I wouldn't
want to use them, though. :(

5812. Edward Cox responds

Newsgroup: rec.radio.scanner
Date: 1997-06-28 00:00:00 UTC
From: Edward Cox <i2567@netnitco.net>
Message-ID: <33B505B9.EF3@netnitco.net>
Source record: 193059
Cross-posted to: rec.radio.scanner,rec.radio.swap,alt.radio.scanner

This is in response to all the writings of Bob9000 about Edward Cox.

I sold him an honest to god 2042. He told me he was replaceing his 2035 with it. First he told me he sent the money order on 5/29/97. I received it on 6/6/97 with a postmark of 6/4/97.

I went ahead and sent the radio to him as promised on 6/9/97. He then E-mails me a rude letter wondering why it took so long for me to get the money order. He receives the radio and immediately starts accusing me of send him a 2035. (I bought a 2035 2 months ago from a gentleman in Ohio, and I still have it.) I then e-mailed him stating "he must be mistaken. I went and checked to make sure I had my 2035 and I did. He then started demanding that I give him $60 dollars as to make up the difference in price. I refused because I believed he was now trying to scam me. I then went on Vacation. I returned a couple days ago & I have ton's of threatening e-mail waiting for me from him with more threats. I then checked the newsgroups and found all these slanderous statements he made about me. But I also have received a lot of e-mail from the other people that have done business with me with nothing but good comments & support that they would still do business with me and would have nothing to do with "Fraudelent Bob".

The true reason I know Bob is lying is he said that the radio he got did not have a serial number & I know that it did, although I don't know what it was. I do know the date code was 12A6.

I also see that not one other person said that they had been ripped off by me and I have sold 112 radios since Jan 1/97.

Well thats all I have to say about the subject. It's a shame that the internet can be such a usefull tool but a few people have to abuse it and ruin it for everyone else.

By the way I gave all my personal info (ie. DOB, Soc Sec #, Full name) to Bob9000 today so that he may file suit or complaints or whatever he wants to do. I have nothing to hide.

Thanks for listening "to the rest of the story"

Ed

Source record: 193063

Jim,

COM1, COM3 generally share the same interrupt (4) and COM2, COM4
share the same interrupt (3). If you have a device such as a mouse on
COM1, you would want to connect your scanner to COM2 or COM4 to
avoid an interrupt conflict. You don't want to have 2 devices trying to
use the same interrupt at the same time.

On my old computer I put my mouse on COM1, my modem on COM2
and my scanner (OS456 controlled) on COM4. To avoid a conflict I just
made sure that I never used my modem and scanner at the same time.

My new system has a mouse port that use interrupt 12. I have my scanner
on COM1 and the modem on COM2. I can now surf the web and use
my scanner at the same. The scanner software is WaveLinks by Percon
Corp.

You said that your scanner would work in DOS but not Win95. If you did
not use a mouse driver in DOS, that would explain why it works in DOS
only.

5819. How to scan cell frequencies?

Newsgroup: rec.radio.scanner
Date: 1997-06-28 00:00:00 UTC
From: PYRO3@ix.netcom.com
Message-ID: <33b5803e.60198786@netnews.worldnet.att.net>
Source record: 193066

Hi,
I would like to know how to scan cell phone frequencies. This is
an academic inquiry of course.
If I have something like a Pro-60, can I convert it to receive
locked out frequencies? Do those adapters advertised to convert 800
Mhz to 400 Mhz really work? Are some better than others?
How do cell phones work? Do they use one frequency or do they
have a transmit and receive like cordless phones?
As you can see (read) I really am lost with this stuff, ANY help
is greatly appreciated!!! I have an extensive background in
electronics (by no means an engineer) , so mods are not out of the
question, and I can build circuits if necessary.
Please reply, with anything related...Thanks !!

Jim

John,
I have been having trouble e-mailing anyone on AOL so I posted this to the group.
I have a PRO43 and a BC2500XLT (Two battery packs and service manual)
Both in EXCELLENT condition and cellular modified.
If that doesn't work, I have a few more toys that might intrest you.
Thanks,
Eddie Kosloski

I've got close to the same setup (no preamp, though) and I've heard a pizza delivery address given almost 1 mile away and my RS three-element vertical is only 10' up. My thru-the-glass RS scanner antenna on my vehicle will only pull in 46 MHz comms about 200 yards though. Not real happy with that antenna as 150 MHz comms are not as clear as through my thru-the-glass dual-band ham antenna. BTW, has anyone gotten good distances on a 900 MHz analog cordless?

Steve S.

Cross-posted to: alt.radio.scanner,rec.radio.scanner

I can't seem to get the two units to work together with the connecting cable. I'm probably overlooking something in the instruction manual for the 8000. When I connect the units together, all I can get the 8000 to do is alternate the display between "REMOTE" and "SCAN," or "SEARCH," whichever mode I am in. Does anyone have the patience to walk me through the proper procedure to capture and tune frequencies?

Thanks in advance!

ankerz

5831. Re: How can I get trunks???

Newsgroup: rec.radio.scanner
Date: 1997-06-28 00:00:00 UTC
From: fkiehner@solution4u.com
Message-ID: <5p482k$d9l$1@comet3.magicnet.net>
Source record: 193078

I use a regular scanner in Apopka (just north of Orlando) to listen to the public service stuff. I used to be a police/fire/ems dispatcher for the city and they use 6 freqs also. Just enter the six freqs in the scanner and let er rip. One of the freqs will have a constant "noise" on it. This is the data channel and may change from day to day. Just lock it out and scan the other 5 freqs. You will be able to hear all that is going on very easily. The only problem you will have is that after each transmission the 2 units talking will move to another of the 5 freqs. You just need to scan them to figure out where they went to. In a small town it is easy to follow the conversation. If you were to listen to Orange County/Orlando city, you would have upwards of 16-20 freqs that would need to be scanned and during a weekday, it is almost impossible to follow any of the traffic going on. That is why the TrunkTracker scanner is almost a must if you need to listen to the "big city" public service stuff.
Hope this helps. If you have any other questions, email me privately at fkiehner@solution4u.com.

5832. Trunk Tracker Questions

Newsgroup: rec.radio.scanner
Date: 1997-06-28 00:00:00 UTC
From: fkiehner@solution4u.com
Message-ID: <5p48he$d9l$2@comet3.magicnet.net>
Source record: 193079

Hi all.
I am thinking of purchasing a Trunk Tracker, since the price seems right. However, I have a few questions. How are the talk groups displayed and can you follow one talk group or does it scan all the talkgroups it receives from the data channel?
Also how does one determine what type of system is being used? As far as I know, it is the Motorola system all over Orange County and the surrounding areas.
Any input would be appreciated as I dispatch pd/ems/fd for the Orlando International Airport and am very interested in listening while I am not at work.
Any input from satisfied users, or those in the know, would be appreciated in advance.
Thanks,
Frank Kiehner

Today I found two handheld radios(monitors ?) that I had never heard of.

The first is a Unimetrics, 11 transistor, AUDITOR II radio. On the the front it says 146 -175 mc and under that it says Crystal Controlled. It is black and looks like a pocket AM radio. Has a telescoping antenna with a bright red plastic antenna ball on the top. On the back it has a two position switch that says tune (on top) and xtal (on bottom). It operates on a 9 volt battery and has a jack labled "ext pwr". There is a tuning knob on the side just like an AM transistor radio and a window on the front that has the numbering from 146 to 175. There is also a jack for an external antenna on the top left. Back info plate says:

Stock No. 3537
11 Transistors
1 Thermistor
4 Diodes

It powers up and I can hear BART trains on 161.40 but obviously you have to guess on the dial where you are.

The second one is also a small handheld transistor which says VISCOUNT AM /VHF-FM Solid State on the front. It also has a telescoping antenna and a two position switch on the back which says AM(on top) and VHF (on bottom). It has an AC adapter jack but no external antenna jack. It too runs on a 9volt battery and works. It says on the back plate Consolidated Merchandising Corp Model 1262. It has a sliding dial on the front with AM on the top and VHF (149-173 on the bottom.

I would appreciate it if anybody having any information on these two radios, please respond in the group or e-mail. I have several older scanners and a BC9000 and 3000, but have never seen these two before.

Thanks

Monty

That radio was manufactured in the 1965-1967 time frame, I,ve got one
that belonged to my father-in-law, it was made in the days before most
scanners were designed. remember the Bearcat II & Bearcat III ? thats
the time period. :)

Jim- I would definately tell you to get Probe. None of the others even
come close. If you had a ICOM and AOR along with your 2035, then it would
be a bit harder decision for other reasons. Probe is fantastic and I run
it in a DOS Window under Win95. Also look into a program call RECALL
which is a voice- activated recorder through your soundcard. Makes a
time-stamped .wav file that matches up with your Probe log file. Great
for unattended scans! You can find RECALL at
http://www.sagebrush.com/~sells/recall.htm and is shareware.

My late uncle had a belief about solid state electronics in that if
they are going to fail they will generally do so early in their
lifespan.

The scanner came with a one year warranty. I'll use it enough during
that time to generate a failure if it is prone to. My first Pro-60
went back after 3 days. Bad electrical connection between the battery
pack and the main unit.

It could be. IBM (at least in Los Angeles) uses a laptop to talk with a
private ARDIS network, for their Customer Engineers.

5851. Re: How can I get trunks???

Newsgroup: rec.radio.scanner
Date: 1997-06-28 00:00:00 UTC
From: jwjeschke@aol.com
Message-ID: <19970628044200.AAA15427@ladder02.news.aol.com>
Source record: 193129

The physical limits of a Motorola system is 28 frequencies per trunked system. Maybe he was referring to 45 talkgroups?

Also, ANY public service frequency licensed by the FCC can be monitored on just about any scanner. "Splinter" frequencies refer to frequencies like 453.1125 and 152.0075, that have 4 digits after the decimal poit, as opposed to frequencies like 460.325 and 460.400 that have three. (For the techies: maybe you could shed some light on why frequencies like this exist... did the FCC somewhere down the line authorize these freqs to effectively double the available bandwidth???)

Hope this helps... it's oversimplified, so if anyone would like to elaborate...

-Jim

5854. OS535 Problems

Newsgroup: rec.radio.scanner
Date: 1997-06-28 00:00:00 UTC
From: Jim Eden <eden@scoot.netis.com>
Message-ID: <33B488C4.E2ACFF5E@scoot.netis.com>
Source record: 193132

Please disregard my last posting. I have since gotten my PRO-2035 w/ OS535 to work in DOS. But in WIN95 Nothing. However. If I use com 2 which is my mouse port it can work. I installed an RS232 port card and assigned it to com 3. Like I said it works in DOS but not in WIN95. Is there a certain setting somewhere. I have looked in the Device Manager area but all the settings look the same.

My Dad has a Realistic Pro-32 and I am curious if there are any known modifications for it. Any responses will be greatly appreciated.

Thanks,
Jeremiah

5857. For Sale: ICOM 735 for only $545.00

Newsgroup: rec.radio.scanner
Date: 1997-06-28 00:00:00 UTC
From: t95194@aol.com
Message-ID: <19970628074800.DAA23169@ladder02.news.aol.com>
Source record: 193135

I have for-sale an Icom 735 for $545.00 plus shipping.
It is in good working condition and has the box & manual. I purchased the radio in 1992, and I am the second owner, so I am not exactly sure on the age,but believe it is 8 to 9 years old. It is just the standard radio, no added extras like filters. I am willing to meet up with someone on the air if they would like to hear the radio.

For more info you can e-mail me at:

t95194@aol.com

Please send inquires to my e-mail address instead of posting them here, since I am not sure when I will return again.

73's & Thanks

Dave (N9NMD)

Source record: 193138

Hi! I'm new to the group and new to scanning. I want to buy my first scanner but I notice all of the low-end models have so many "missing" frequencies. Isn't there a scanner at any price that covers ALL the frequencies? Any recommendations would be great, especially recommendations for a scanner that can interface with the PowerMacintosh. Thank you. You can email me at: bybirdie@aol.com

Regards,
Pam

I'm looking for the ID's for the Dublin, CA PD and the Camp Parks PD on the Alameda County Trunked System. Going to order a TT tomorrow and want to be ready. I have some good information already for Almeda County but not these two yet. If anybody could help I would appreciate it.

Thanks

Monty

I am unsure of the model number, but a long time ago Radio Shack had a crystal scanner that had orange display lights, silver knobs (2) and was thin and had a white front. I used to have one and would like to have another. Working, of course.

Thanks.

I was listening to interference on a local PD dispatch freq. Sounded like a little kid had a radio, and was breathing, whining, and making misc noises (scraping sounds, etc). This went on for about 5 mins, then an officer keyed up... "I've found the source of the interference; my dog was chewing on my portable!"

The VHF Aero band was expanded about 500 kHz from 136 to 136.500 or so.
Not to 144 MHz. The overcrowding of the aero band will be resolved with
12.5 or 8.33 kHz channels (North America or Europe) in the near future.
Also, probably switching from AM to TDMA as well.

5880. BC200 no audio?

Newsgroup: rec.radio.scanner
Date: 1997-06-29 00:00:00 UTC
From: Barney <kl7hny@sl.net>
Message-ID: <33B69226.4CA2@sl.net>
Source record: 193141

Hello, all. Awhile back, before mine failed (naturally) I saw a post about some regulator or pass transistor or such that fails commonly in BC200/205/Regency R4030. Common symptom seems to be all channels locked out of scan lists, freq display seems to work, but the audio sounds like the DC gates on but no audio is ever heard. No manual here, too cheap to spend $49.50 to send it to Uniden, and unable to find any repair hints via websearch. If this rings a bell with anyone, please email me? Thanks.

F O R S A L E

MARACOM M5100 VHF Marine Transceiver ----
5 and 25 watt transmit on marine frequencies.
Receives 9 NOAA weather channels, transmits
on channels 01-28 and 65-88. Digital readout.
About 7" wide, 2.25" high, 7"deep. White case
with black faceplate. Includes microphone, no
mounting hardware. Only $ 60 + shipping in US.

MOTOROLA MTX9000 fm handi-talkie radio,
model H01WCF4DB5AN NX type WCMA.
900mHz range. With charger and info.
Only $499.

COAX CABLE ---- heavy-duty, 1cm diameter, black plastic
covering, with foam dielectric. New, was on wooden spool
until I unwound it to get approximate length of 300 + feet.
No marking on cable; spool label says 1GHz. Was left
after cable TV upgrade, so probably 75 ohm. $20 + ship.

------------------ F L A S H L I G H T S ---------------------

4-D cell (2x2 style), krypton bulb. In box, never used.
$5 + shipping.

6-D cell multifunction lantern. Sleek tubular style with
bright incandescent light at end, 6W fluorescent bulb
along bottom, and flashing red and yellow on top. Also
has electronic sonic alarm that can be switched on with
the flashing lights. In box, never used. $12 + shipping

3-C cell Eveready worklight-style. Bright yellow with
hook for hanging, frosted bulb to diffuse light over area.
Unused, but no box. $5 + shipping

Batteries NOT included.....

COCA-COLA caps. Red cloth, white lettering. New.
$8 each + shipping. Only 9 available.

.... FOR YOUR DRIVING PLEASURE ....
1929 Mercedes SSK kitcar on VW chassis. Just completed, never titled.
Yellow, with brown fenders and running board, tan convertible top, side
curtains, and tonneau cover. Gold trim instruments.

COBRA 18-ULTRA CB ---- 40 channel, pushbutton tuning, with 3
NOAA weather channels. Includes microphone, but no mounting

hardware. $ 35.

LEXMARK/IBM PORTABLE PRINTER 5183 ---- powered by rechargable battery or AC wall adaptor (included), this printer is only 11.5" x 3.5" x 2", and weighs about 2.5 pounds with battery in place. Using silent thermal print head, it will print on either thermal fax paper or on regular paper using the enclosed thermal transfer ribbons. Very quiet in operation, and because it runs on a battery, it is completely portable, for use with laptop computers anywhere. Includes parallel port cable. $89.
.

ANADEX WORD-SCRIBE PRINTER ---- heavy duty dot matrix printer. Multiple ports, but no literature so only parallel port in use now. Tractor or friction feed. Fast, good quality; 17-inch platten. $ 15
.
add shipping to all prices, only in US....
if interested, leave e-mail...

>Are any of the Florida local or state trunked systems still simulcast on
>their old VHF/UHF freqs??

Yes. The Collier County EMS still simulcast their dispatch channel on
154.2950 MHz, fortunately. Other than that, they're using the Collier
County trunked system, which is shared among the Sherrif's office, the
building inspectors, the fire/EMS folks, the sewer inspectors, etc.,
etc.

Then why don't you consider joining our team ?

We can promise you a high level of activity and lots of hot news!

All our correspondence is based on exchange of E-mail. The whole team participates in any scanner-related subject. New Scanner-frequencies are shared, equipment evaluated and tested, discussed, traded, bought, or sold! We now have well in excess of 2200 norwegian frequencies in our tables to share!

You MUST own a radio scanner to join us, though.

>

I have two batt packs for my PRO-60. The first is the one that came
with it with six of those purple rechargable AA's in it. The second is
the
black battery pack that is sold seperately (that comes with the charger).
When i used fresh Enegizers, the scanner worked for about 8 hours
continuously on. The battery pack runs for about 5 hours, and the purple
rechargables work for about 4 hours. Do they last longer? Definitely
not.
Are they more cost effective in the long run? Well, if you use yours as
much as I do, yes. But that battery pack is pretty expensive. You need
to
by the 9V wall outlet adapter as well to plug into the charger / scanner.
If you just use it every once and a while, I'd definitely recommend the
purple rechargeable batteries and the 9V wall adapter.

Do you live in Norway and own a radio scanner?
Then why don't you consider joining our team ?

We can promise you a high level of activity and lots of hot news!

All our correspondence is based on exchange of E-mail. The whole team participates in any scanner-related subject. New Scanner-frequencies are shared, equipment evaluated and tested, discussed, traded, bought, or sold! We now have well in excess of 2200 norwegian frequencies in our tables to share!

You MUST own a radio scanner to join us, though.

Please visit our homepage at:
http://www.geocities.com/SiliconValley/4607/

5888. trunker.exe

Newsgroup: rec.radio.scanner
Date: 1997-06-29 00:00:00 UTC

Cross-posted to: rec.radio.scanner,alt.radio.scanner

I'm interested in speaking with someone who has gotten trunker.exe to acutally work. I'd like to ask you a few questions..!

1. Which trunker.exe are you using. Do I have the right one? (I.e. date and time of trunker.exe)

2. Am I using the "correct" Hamcom interface? What schematic did you build your's from? Did you make any modifications to the interface to make it work better?

3. When tapping the discriminator audio, did you attach a cable directly to the discriminator output..or use a capacitor on the cable?

I have been unable to get this to work, and would like to chat with someone who has been able to....I must be missing something here.

TIA

5889. Re: Funny Dispatch

Newsgroup: rec.radio.scanner
Date: 1997-06-29 00:00:00 UTC
From: Dennis Wenger <Dwenger@worldnet.att.net>
Message-ID: <01bc84c1$a0a73b00$1b5492cf@default>
Source record: 193150
Cross-posted to: alt.radio.scanner,rec.radio.scanner

About 15 years ago, I ran an auto tag that had what I thought was a
suspicious person waiting at the rear of a local Oriental Restaurant. My
dispatcher refused to give it to me over the air, and forced me to return
to the station, 3 miles away to get the info. It seems that the car was
registered to one "Fuk Fu"---no lie.
It was also fairly common practice for a cocky green rookie to be
dispatched in the middle of the night to look for a "10-71" (I think)
at the local Funeral Home. Of course, the effect was no good if the
dispatcher didn't convey a sense of urgency in her tone of voice as she
dispatched him to go
"look for a body".
And its been a long time since I've heard the "older timers" talk about
the time that one of them ran over a 'Possum, then later on found another
cop
asleep behind the wheel out in the middle of the woods. I'm sure that you
might be able to guess what came next..."Sleepy cop" awoke to find
himself nose to nose with "Mr. Dead 'Possum". As the story goes, "Sleepy
Cop" had to pay for a new windshield after he emptied his revolver into
the already dead 'Possum.

Does anyone know the new frequencies for the Redondo Beach, CA Police. Some time this week they seem to have disappeared from their regular frequencies. Also, the Fire Dept. also seems to be moving. Traffic is way down. I think I may only be hearing Mutual Aid type traffic rather than Fire.

Any help is appeciated.

Buy a set of Ni-Mh batteries for your Pro-60. My son is a Radio Shack ass't mgr and swears by his Pro-60, but went "the Ni-Mh route." He gets over 12 hours of active use with Nickel-Metal Hydride (Ni-Mh's) batteries. Stock charger works fine. I did the same for my Pro-43, but I got the Metro-West charger/docking stand, which also conditions the batteries, and makes them last longer!

We have a "Batteries Plus" nearby in suburban Lombard, Rt. 38 / Meyers Rd, west of Chicago. We paid approx. $3.69 each for the Ni-Mh's.

Source record: 193165

Does anyone have a list of the US Coast Guard frequencies that are referred to as "LANT" channels? These are VHF (maybe also UHF) freqs, other than those in the regular marine radio band, that are used for various CG traffic. I only know 1 or 2 of these channels, i.e. LANT 40 is 164.550 mhz. I'd appreciate any info that's available. These freqs might be confidential, so they may not be widely known. Thanks in advance to anyone who can help.

Its quite legal to take a scanner into the UK. I would advise though
that you do not program any freqs into the memories as it has been
known for the police to stop and question people seen in public using
scanners,,also before you turn it off,make sure the freq it is
displaying is one which would not cause any problems should it be
examined by a police officer.

Hi There,

These should do the trick. This is everything we have had submitted to
us for baby monitors. You can also view them at our site.

National Frequency Database
http:www.agt.net/public/gpnet/gpnet.htm

Take care,

Dale

Source record: 193185

I'm wanting an inexpensive scanner for my wife. This is all it has to have:

1) Weather Alert: activates when NOAA broadcasts emergency signals
2) about 10 channels

I'm basically wanting a weather watcher so when bad weather approaches,
the weather signal will turn the NOAA weather channel on and if she wants,
she can easily listen to the local DES.

Any recommendations on scanners that would fit our needs?

TIA,
Grady

Hi Bob,

you should mention that it can be programmed out of band
by entering a decimal point in front of the frequency
being entered.

example: .406.875

The scanner had a frequency range of 440 - 512 Mhz in the
UHF band.

Bob

> frequencies programmed in before they are sent out in service, just as ours
> are ?

Tom,
As someone who has recently set up a private 7 channel Motorola trunked
system
I can tell you that the only frequencies that are programmed into the
radio by
the dealer/programmer/user or whoever is configuring the radio are the
control
channels.

However...the radios do *not* receive direct frequency information from
the
system controller on the control channel either. Rather, they are given
a
_channel_number_ which relates to a frequency. The list of channel
numbers vs.
frequency is hard-coded into ROM in the radio. This is how, when the
controller
tells a radio to change to channel 702, that the radio knows to go to
(for
example only), 868.0625MHz RX and 823.0625MHz on RX. These channel
pairs, btw,
are always 45MHz splits at 800MHz. The channel numbers are also used
world-wide
by Motorola and always refer to the same frequencies.

The only difference is that certain frequencies (ie 821/866MHz) that are
not used
in the USA are used in other parts of the world (eg here in Australia)
and hence
the radios have a programming option which tells them whether to use the
Domestic
or International channel assignments.

Cheers.

Charlie,
That IS cellular that you hear.
That is called an ' image frequency '
It is only possible with a dual conversion radio and is not
possible with a triple conversion radio.
The image frequency is 21.6mhz above the actual cell frequency.
Ex. If you hear a conversation on 902.400, the actual cell frequency is
880.800mhz.
I hope that clears things up a bit.
See Ya,
Eddie Kosloski

C'mon, Motorola can't even keep it consistent in their different RSS
packages
for different radios. Some programming software is written in the US,
some in
Europe/UK, some in Israel and some in Asia. Each has different
terminology for
the same parameter. Some use Hex for talkgroup and unit ID's (type II)
or fleet/subfleet ID's (type I) and some use decimal! If Motorola can't
decide
which one is better to use, why should Uniden not use decimal instead of
hex?

>[...]
> work that way, if they can legally do it. Or maybe a radio that Uniden
> makes for about $110 doesn't quite have the same inards as say a Motorola
> MTS2000 portable at $2000.

Actually, the "inards" (sic) of the MTS2000 and those of the Uniden
scanner
probably cost about the same to make. The Uniden also covers a much
wider
frequency range on RX than the MTS2000, doesn't have a TX stage, appeals
to
a mass market (rather than a specialised market like the MTS2000) which
doesn't include a large proportion of business/commercial users and
doesn't
have the "Big M" or Motorola name on it (dare I say it, there's the key
to the price difference...)

Guess who hasn't read the Motorola trunking system documentation?

Codeplug is generic Motorola-speak for a PROM (be it OT-PROM, EPROM, EEPROM)
or the data image contained therein. This applies equally to the trunking
controller as it does to the radio. Therefore Dave's statement is correct.

>[...]
> > The radios therefore, know what all possible channels are, and do a

> >
>
> Sorry the radios do not know what channels to go to unless told by the
> controllor.
>

I thought that was what he said (perhaps not so clearly). The controller
tells the radio the channel number and the radio does a lookup of ch #
vs. frequency (or by calculation, as you state below) and changes
accordingly.

> It is the FCC channel assignments that the controllor spits out and the
> radio converts to a frequency. Some by a list programmed in the radio
> software and some by doing some math.

No, the list is in firmware, not software. The channel vs frequency list is
not end-user programmable (in almost all cases). In order to change that you
need to change the ROM data in the radio (*not* the codeplug data in the
EEPROM accessed by the RSS) which requires a change to be made by the
factory.

5944. FS: Federal Signal Corp. "Smart Siren" Model SS2000

Newsgroup: rec.radio.scanner
Date: 1997-06-29 00:00:00 UTC
From: MiKeY <repo-man@usa.net>
Message-ID: <33B60C45.C5549918@usa.net>
Source record: 193214

I have a Federal Signal "Smart Siren" for sale. It has a small control head connected by a telephone type modular cord to the power unit. It also controls emergency lighting.

Missing power cable,<uses same cable as Federal PA300> but includes Microphone for P.A.

List Approx. $800 Sell $350 or best

Also have a Federal PA300 siren/PA for $150 also w/o power cable

Thanks,

MiKeY

rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article discusses the purchase of used scanner radios
and includes these topics:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other

radio hobbyists.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Radio Shack repairs scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series (see US patent 4,011,515, granted 3/8/77). Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Tennelec | MCP-1 (see US patent 3,961,261, granted 6/1/76), Bearcat | BC-101 (see US patent 4,179,662, granted 8/4/78), and Radio | Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. See US patent 4,057,760, granted | 11/8/77. The GRE-manufactured SBE Optiscan (and its Sears clone) required poking or covering a series of holes in

plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer Uniden/Bearcat BC3000XLT and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to

cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

Electra Corporation stocks crystals for the Bearcat scanners:

Electra Corporation
11915 E. Washington St.
Cumberland, IN 46229
Phone 317-894-3229

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 1997 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

One way to roughly estimate a radio's age is to examine the
4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most

recent date stamp.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 11915 E. Washington St., Cumberland, IN 46229. Phone 317-894-3229.

To order a user manual for an Electra/Bearcat scanner from Uniden, call (800)235-3874 extension 2553.

Some schematic diagrams may be obtained from Uniden/Bearcat's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges.

The phone number for repair is (800)297-1023, too. I recommend you call repair before sending the broken scanner. Items for repair via UPS (include receipt if still under warranty) are usually sent to:

Uniden America Corp.
4700 Amon Carter Blvd.
P.O. Box 95002
Fort Worth, TX 76155

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267.

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and
2. a "feature board" containing the microprocessor controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal

chassis. The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

Paul Grohe replaced a failed C98 with a low ESR (equivalent series resistance), high frequency, switching regulator grade capacitor, e.g. a Panasonic HF series capacitor. He also recommends adding a 0.1 ceramic capacitor in parallel with C98.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Failure of IC9, the 9 volt NJM78M09A regulator in a BC800XLT is another cause of a blank display.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal

required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the

two pins with an X-Acto knife fixed the problem.

Uniden/Bearcat BC200XLT Portable
Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there is no audio and the green backlight no longer functions, a tiny transistor may have failed.

Check for a defective PNP surface mount transistor, Q201 (2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC to several stages of the BC200XLT. Its main purpose is to switch off power hungry stages of the BC200XLT when the CPU thinks the NiCd voltage has fallen below a threshhold. That's an attempt to limit the current drain on weak NiCds to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board, adjacent to the black multi-pin connector which mates the Micom and main boards together.

Q201 can be destroyed by a few different causes, primarily, by something in the scanner drawing too much current through it. In one case, capacitor C36 shorted. It's a 220 uF 10v electrolytic, located on the component side of the main board, connected from pin 8 of the audio IC (IC2 NJM386SL) to ground. Capacitor C55 shorted in another BC200XLT. In a pinch you bypass Q201 by soldering a short piece of bare wire between the collector and emitter, but you must first fix the component which caused Q201 to fail.

BC9000XLT: Loss of Sensitivity

John Ward has fixed two BC9000XLTs which suffered from "low sensitivity." He fixed the solder joint where the antenna jack connects to the circuit board. In both cases the tab from the board was on the opposite side of the jack from where the little blob of solder applied at the factory was located.

It was an intermittent problem that depended upon the position of the antenna cable - if the weight of the cable placed tension on the jack in one direction contact was made and the radio worked fine. If the cable placed tension on the jack in the opposite direction contact was lost and so was reception. The gap was barely noticeable.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder
connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier
activated relay inside the BC890XLT wore out. Andy found
the identical relay sold at Radio Shack (part #275-232) and
says the BC9000XLT uses the same relay, too.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner. The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.]

I am often asked, "How do you find these frequencies?" This article answers the question in various sections:

Books
Magazines
Government Records
Web Sites
Federal Radio Stations
Radio Clubs
Do Your Own Sleuthing
What Makes Station Identification Difficult?
Examine the FCC License on Premise
Examine the Labels on Radio Equipment
Equipment to Determine Frequency Usage
How Can I Determine To Whom I'm Listening? - An Example
Summary
Addresses

Books

The most convenient source of fire and police frequencies is the Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores for under $13. Police Call Plus is

basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. A few pages of local airport and nonsensitive federal government frequencies are included. Selected business frequencies are listed, too, but without callsigns and other details.

I highly recommend Richard Barnett's 1992 book, Monitor America, published by Scanner Master Corp. A 3rd edition is available from Grove Enterprises for about $30. It is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the Radio Communications Monitoring Association (RCMA), now defunt. Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call Plus, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The longstanding source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is a good

book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and the sensationalistic Popular Communications magazines.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $100 instead.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100.

The PerCon Spectrum CDROM sells for under $30 and contains a handful of fields for every FCC license in the US. However, Public Safety license information contained in the Winter 1996 Spectrum doesn't appear as up to date as in the 1997 Police Call Plus.

Spectrum works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at

http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Web Sites

If you have access to the World Wide Web, you can visit dozens of sites with local frequency lists.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'. (See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a

frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available on the WWW page http://aosc.rpmdp.com and from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are

really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using

call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

REPAIR TIPS: RADIO SHACK SCANNER RADIOS

Copyright 1997 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

Radio Shack has been selling scanners and monitor receivers
under the Realistic and Radio Shack labels for over 30
years. Most of them were manufactured by General Research
Electronics of Tokyo, though many newer models are
manufactured by Uniden.

The date of manufacture is usually printed on a gummed
label on the scanner as well as the cardboard box. A code
of 12A5, means the scanner was made in the 12th month of
1975, 1985, or 1995, for example.

There's another way to date Radio Shack scanners
manufactured by Uniden. The first digit of the long serial
number is usually the last digit of the year of
manufacture.

Another way to roughly estimate a radio's age is to examine
the 4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most
recent date stamp.

Schematics, Owner's Manuals, and Parts Available

Service manuals for most Radio Shack scanners may be ordered through your local Radio Shack store.

If Radio Shack doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267.

Parts lists for recent models are available on line at: http://support.tandy.com/support_electronics/2849.html. Parts may be ordered through Tandy National Parts, telephone (800)442-2425 or (817)870-5600, or through your local Radio Shack store

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

GRE-Built Base Models: Dim Backlight

The backlight in many base models, including the PRO-2022, PRO-2004, and PRO-2005/6 is implemented by an electroluminescent panel, which grows dim with use.

The EL panel used in the PRO-2005 and PRO-2006 is designated EL-501, and is identified by Radio Shack part #10800050. A new EL panel can be ordered through your Tandy National parts (see above) or local Radio Shack store and sent to your home. Radio Shack no longer sells replacement EL panels for the PRO-2004.

Replacing the backlight is an operation which requires care and patience. Purchase a service manual, and study the | exploded parts diagrams as you read the following steps. |

Top and bottom cabinet pieces must be removed, then the | speaker unplugged from the main board. The front panel | assembly must be removed from the chassis by removing 4 | flat head screws, 2 on each side. You need not disconnect | all the wiring harnesses, though you might have to unplug | one so it won't get in the way of a hot soldering iron. |

Unsolder the bare ground wire soldered to a large shield on | the back of the front panel, located near the back of the | squelch control. Two ground braids must be temporarily | disconnected by removing the screws which fasten them to | the chassis. After removing the volume and squelch knobs, | you must remove 8 small screws which fasten the plastic | front panel to the diplay board. |

The old EL panel is fastened by a bead of glue and two foil | type leads soldered to the display board. It's easier to | cut the two leads from the old EL panel before unsoldering. | A sharp knife should be used cut away the glue. The old EL | panel can then be slid gently out from behind the LCD | display. |

The new EL panel can be installed by reversing the process, | though I found that it is not necessary to glue the new | panel. The two foil leads must be soldered using a minimum | of heat. Reassemble the pieces in reverse order of | disassembly.

GRE-Built Portables: Worn Out Keypads

The keypad on late model GRE-made Radio Shack portables, e.g., PRO-39 and PRO-43, can become unreliable after prolonged use. The best repair is to replace the rubber keypad instead of trying to restore contacts using chemicals. A replacement rubber keypad may be ordered inexpensively through Tandy National Parts or your local Radio Shack Store.

PRO-43: Loss of Audio

Early PRO-43s were built with a 200 mW speaker (mfr's part #EAS-3P123A). The voice coils in some of these speakers have opened, resulting in lack of audio output, though audio is still available from the earphone jack. A more capable 500 mW speaker is available through Tandy as replacement (EAS-3P127).

PRO-43: Freezup

If you attempt to lock out all 20 channels in a memory bank, then scan only that bank, your PRO-43 will freeze up and be placed into a catatonic state. Use the procedure documented in the PRO-43 user manual to fully reset the scanner. This will "break the trance," but all the memory channels will be cleared.

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their crystal controlled, transistor Plectron and Motorola desktop monitor receivers. They have now been replaced by battery operated portable pagers, and the desktop models are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. They are desktop models which can be powered from 117VAC or 12VDC with the proper mobile cord. The audio quality of a Plectron P1, Plectron 700 series, and Motorola Alert Monitor is far better than any consumer grade scanner and the sensitivity, image rejection, and intermod immunity is outstanding when aligned properly.

The Plectron and Motorola Alert monitors are single band receivers: VHF-low, VHF-high, or UHF. No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

AC power cords for both types of receivers use unique connectors and are scarce. You can buy them new but it's much cheaper to drill a hole on the rear panel and attach a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. You can also get Plectron repairs and parts from:

Northeast Communications
4 Oak Ridge Rd
Newfoundland NJ 07435
201-697-8804

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

Plectrom SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model	UHF	VHF-high	VHF-low
SM-301	X	X	X
SM-302	X	X	
SM-303	X	X	
SM-304	X	X	

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) /
10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

I currently have no Plectrons or Motorola Alert Monitors
for sale. I'm hoarding them. :-)

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1996 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers		
Receiver Model No.	Res-istor Value	Stock Comments
Radio Shack PRO-24	R35	33K replace with 220K. Located between pins 12 and 14 of MC3357 (IC1)
Radio Shack PRO-2002	R197	47K try 220K.
Radio Shack PRO-2004	R148	47K remove R148 or replace with 220K.

FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA.
High level overviews of the following topics are presented:

Why Scanning?
Is Scanning Legal?
What Scanner Should I Buy?
What is a CTCSS and DCS Tone Squelch Feature?
How Do I Determine the Proper CTCSS or DCS Code?
Scanner Antennas
Coaxial Cable Feedlines
Where Can I Buy A Scanner?
Modifying Your Scanner
Scanner Repair Shops
Where Can I Obtain Frequency Information?
Do Your Own Frequency Detective Work
How Can I Use Equipment to Uncover New Frequencies?
Scanner Clubs and Mailing Lists

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,

taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies. It's clear from the discussions posted on the Internet that Americans still listen to whatever they want in the privacy of their own homes despite the laws.

It is illegal for companies to sell or import into the USA recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

The rules define "readily altered by the user" as "clipping the leads of, or installing, a simple component such as a

diode, resistor and/or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip using special access codes or an external device, such as a personal computer."

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations and the AR5000 works well.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. Beware of low cost programmables which can't search. Some of the newer models, like the Uniden SportCat and Radio Shack PRO-2046,

allow searching between limits, but the limits are factory programmed and cannot be altered.

Get a model which covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 50 channel scanner will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate. The $2000 Icom R8500 and AOR AR5000 models are exceptions.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, BC230XLT, and Radio Shack PRO-43 and PRO-60 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites.

Looking for value? At $180 discount price, the 100 channel Uniden/Bearcat BC860XLT base is a good value and available at most Wal-Mart stores. The new RELM HS200 portable performs very well is an excellent value at its $250 street price.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 was replaced by the 1000

channel PRO-2035, which was replaced by the PRO-2042. The portable Radio Shack PRO-64 and PRO-60 are good performers. All five models employ up conversion and are made for Radio Shack by GRE (General Research Electronics).

CTCSS and DCS Tone Squelch Feature

Upscale scanners can be optioned with a subaudible tone decoding squelch circuit. There are two types: CTCSS (Continuous Tone Coded Squelch System) and DCS (Digital Coded Squelch). In simple terms, this feature lets your scanner ignore signals you don't want to hear.

Most land mobile two way radios, except trunked systems, transmit either CTCSS or DCS signals subaudibly along with the voice information. U.S. military field radios employ wider deviation and a 150 Hz CTCSS tone, not supported by most scanners or CTCSS decoders.

There are over 40 different CTCSS codes and you can program a specific CTCSS or DCS code into each memory channel. Using a CTCSS or DCS decoder permits your scanner to open the squelch only if the transmission has a code which matches the code you program.

CTCSS and DCS decoding offers several advantages:

1. Ignore unwanted signals on shared frequencies: It is common for several users to share the same frequency, e.g., my county sheriff uses the same frequency as Chicago Police, located about 60 miles away. I want to hear my sheriff's transmissions but don't want the scanner to stop on or listen to Chicago Police transmissions. This is especially a problem when radio propagation is good, e.g., during a "band opening," when reception range is temporarily increased.

2. Combat intermodulation interference: Helps keep out intermod and image interference from strong pagers and other signals which are not transmitted with a matching code.

3. Ignore scrambled transmissions: Many federal law enforcement agencies (FBI, Secret Service, etc) and some local police agencies employ digital voice scrambling, which sounds like white noise and is annoying to hear. The CTCSS or DCS code is sent only when the station is transmitting unscrambled, or "in the clear." You can program federal frequencies along with the proper code into your decoder-equipped scanner so you won't have to listen to the scrambled mess and only hear their transmissions when they are

unscrambled.

CTCSS also goes by various tradenames: Motorola's PL (Private Line), GE's Channel Guard, and RCA's Quiet Channel. Motorola uses the tradename DPL (Digital Private Line) for its digital coded squelch.

How Do I Determine the Proper CTCSS or DCS Code?

There are a few ways to determine the CTCSS or DCS code transmitted by a station:

1. Use an outboard CTCSS/DCS reader which must be attached to the discriminator output circuitry inside the scanner. The reader has an LCD or LED display which indicates the code when a station transmits. I use a CSI model CD-1 Communications Decoder Unit, an an excellent reader which sells new for about $200. (Connect Systems Inc., Ventura, CA, 800-545-1349, www.connectsystems.com).
2. Many of the ScannerMaster guides, as well as scanner club newsletters, print the CTCSS codes used by transmitting stations.
3. On some scanners equipped with the CTCSS squelch, you can program into memory the frequency of interest. Then you "tune" slowly through all the different CTCSS and/or DCS codes until the squelch opens and you hear the dispatcher talking. This is a slow process and the station has to keep transmitting during it.
4. A slow, brute force method is to program the same frequency but a different CTCSS code into several channels and see where your scanner stops.
5. In some cases, I've actually examined the walkie-talkies I want to monitor and found the CTCSS code printed on a label on or inside the radio.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer these alternative antennas for use with portable scanners:

1. The Icom FA-1433B dual band flex antenna, a thin and very flexible rubber antenna, is slightly longer than a stock heliflex but provides better performance.
2. The Austin Condor is a 12" long rubberized antenna available for about $30. While considerably longer

than the stock antenna and the FA-1443B, the Condor is very flexible and provides VHF-high band reception superior to both. It is not designed to cover the VHF-low band, but will allow reception there at least as good as shorter antennas.
3. The "Thin-Stick" is an 18 inch telescoping antenna for extended range. It is made in USA by Smiley Antenna Co., Inc. and is designed to cover both the 2 meter and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U, e.g., Belden type 8267, has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Be sure it is on sale, as Radio Shack list prices are high and their scanners are offered at reduced prices by mail order discounters.

Discount chain stores like Wal-Mart, Best Buy, K-Mart, Service Merchandise, and Circuit City sell scanners, but

carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove.net

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411. Web page is www.aesham.com

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

For information on "virtual downconverter" modifications, see Steve Donnell's article in January 1995 RCMA Scanner Journal or February 1996 Monitoring Times. Reprints of articles from Monitoring Times are available for $3.00 each plus a self-addressed stamped envelope from:

Grove Enterprises,
7540 Highway 64 West,
Brasstown,
NC 28902. For a free catalog, call (704)837-9200.
Telephone (orders only): (800)438-8155.

I don't get any part of this reprint fee.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company which repairs scanners:

- G & G Communications (telephone 716-768-8151) - (www.iinc.com/ggcomm or email ggcomm@iinc.com or ggcomm@aol.com) This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Repair tips for Bearcat and Radio Shack scanners are discussed in two other FAQ articles.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores. The newest editions contain selected business listings, too, although callsigns and other details are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200, www.grove.net) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning (NatScan) is a national

scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. Early issues disappointed experienced scanner hobbyists, but it now has a good column on scanner modifications and has greatly improved its coverage of east coast frequencies since merging with NESN (North East Scanner News). The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

The Scanner Club is the name of a bimonthly magazine published by Les Mattson. It is a successor to the Northeast Scanning News and is the official publication of The Scanner Club, a not-for-profit club organization. TSC's main strength is local frequency information, including CTCSS codes. Sample issues are $4 each. A yearly membership costs $24.95 and includes 6 issues. Write to The Scanner Club, PO Box 62, Gibbstown, NJ 08027 for more information.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM for $100. In the 1995 edition, fields are different than PerCon's Spectrum CDROM but the data appears to be of the same vintage. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities,

highways, airports, military installations, national parks, etc.

The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Peter Laws administers an electronic mail list read by over 700 hobbyists devoted to scanners and scanning. It's called "scan-l" and for more information, read:

http://www.wildstar.net/~plaws/scan/scan-l.txt

Clay Irving <clay@panix.com> administers a scanner electronic mailing list, called "scanning." To subscribe, send an Email message to: majordomo@lists.panix.com

In the body of the Email message, put: subscribe scanning

All Ohio Scanner Club

- 2 -

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. You can obtain an electronic subscription to the CARMA Newsletter. For more info, see:

http://www.TheRamp.net/shabec/carma.htm

The club's mailing address is:

CARMA
P.O. Box 2681
Glenview, IL 60025

Some CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. There is a $15 annual fee for the BBS. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (630)852-1292.

All meetings are held on Saturdays at locations announced in advance. Meetings are usually held at:

- the Destiny Restaurant, on Rand Road, in Des Plaines,

- Philly's in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook,

- The Great Escape, on Irving Park Road, Schiller Park

and at other restaurants.

SCANNER RADIO REVIEW BRIEFS

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than 70 old and new scanner radios and monitor receivers.

The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.

Introduction

At last count, there were over 140 scanners and monitor receivers of various brands in my collection. This article describes a few of the FM receivers in my collection, and other models I've tested. It is not meant to be complete.

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass, Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass, Monitoring Times, May 1995.

I have published full length reviews and modifications of these scanner models in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004

Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurements
Dec 1995 - Radio Shack PRO-2040
Feb 1996 - Radio Shack PRO-2042
Apr 1996 - Uniden/Bearcat BC220XLT, BC230XLT Portable
Jun 1996 - modifications & tips for the Uniden/Bearcat BC9000XLT
Jul 1996 - Uniden/Bearcat BCT-10 mobile
Oct 1996 - Radio Shack PRO-2046 mobile
Dec 1996 - AOR AR5000
Jan 1997 - ICOM R8500
Feb 1997 - Radio Shack PRO-2045
Mar 1997 - ICOM IC-R10
Apr 1997 - RELM HS-200 portable
May 1997 - Uniden/Bearcat BCT7 virtual downconversion mod.
Jul 1997 - Uniden/Bearcat BC235XLT portable Trunktracker

Note: Reprints of Monitoring Times articles are available for $3.00 each plus a self-addressed stamped envelope from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this reprint fee.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features

than any other radio. DTMF reader and RS-232 interface included. Multiple settings for IF and AF selectivity, attenuator, AGC, deemphasis, etc. DB9 RS232C connector. Negatives include low contrast LCD display and difficult user interface. NFM squelch closes slowly, causing noise burst at end of each NFM transmission. Electromechanical relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of mixed band frequencies. Great radio, otherwise. See "AOR's AR5000 All-in-One Receiver," by Bob Parnass, in Monitoring Times, December 1996.

ICOM

R-10: late 1996 vintage (serial number 01048 tested). Shirt pocket size multimode is powered by 4 AA penlight cells. Covers 0.5 to 1300 MHz (minus cellular). NFM, WFM, USB, LSB, AM, and CW detectors included. IF bandwidths are fixed. No 30 kHz bandwidth for satellite or FM military monitoring. Battery saver circuit, with selectable duty cycle. Single VFO and 1000 memory channels. There are 900 memory channels divided into 18 banks of 50 channels each. Another bank of 100 channels used to hold unique frequencies found during an auto store operation. 20 pairs of search limits. Up to 100 frequencies may be locked out during a search and stored in a final bank of 100 channels which is cleared before subsequent auto store searches. Each channel can be programmed with the detector mode (e.g., AM, USB), a tuning step size, an attenuator enable flag, and an 8 character label. CI-V computer interface requires extra cost hardware. 7 segment S-meter. Noise blanker. Good sensitivity. Lighted keypad and display, but keystroke sequences are cumbersome.

Good radio hardware in a handy sized package, but scanning performance unimpressive. Very slow memory scanning at only 6 channels/second. Searches at about 16 steps/second, with little or no worthwhile improvement using the "Signal Navigator" feature in the R10 I tested. Rescan delay cannot be disabled. Can only scan one memory bank or all banks, not a combination of banks. No squelch for SSB or CW modes. See "ICOM IC-R10 Receiver," by Bob Parnass, in Monitoring Times, March 1997.

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception

of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the ICOM user with a very annoying clickety-clack, clickety-clack! For Baseband Audio out, I mounted an RCA jack on the back of the R7100A and connected it via shielded cable to the junction of resistors R228 and R230 on the Main Unit. This point is located in the vicinity of IC15 and X3 on the schematic.

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks of 40 channels although bank sizes can be changed. 100 Auto store and 100 Skip memories but that can be increased by reallocating channels from the conventional scan banks. Fixed and programmable step sizes. Relays clickey-clack while scanning across band boundaries. Triple conversion, First IF is 48.8, 778.7, or 266.7 MHz, depending on band. Second and third IFs are 10.7 and 0.455 MHz. Weak to moderate cellular images starting near 1106 MHz. Rugged construction. External power supply. DB25 RS232C connector. Audio peak filter. Ok scanning and great searching performance. See "ICOM R8500 Receiver," by Bob Parnass, in Monitoring Times, January 1997.

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout. See US patents | 4,092,594, granted 5/30/78 and 4,114,103, granted 9/12/78 | for further insight.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. See US patent 4,270,217, granted May 26, 1981. LED readout. Good scanner, but tinny audio.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may

fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels See US patent 4,270,217, granted May 26, 1981. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite. See US patent 4,409,688, granted 11/11/83 for further insight.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz

on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. For a full review, see "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times. See US patents 4,947,456, granted | 8/7/90, 5,163,161, granted 11/10/92 and 5,212,817, granted | 5/18/93 for further insights into fast scanning and | searching implementation.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC230XLT (Uniden): See BC220XLT.

BC235XLT TrunkTracker(Uniden): 1997 vintage. Portable with 300 channels in 10 banks. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. A query feature identifies duplicate memory channels. Very fast scan and search rates. Scans 64 channels/sec and skips empty channels. Service search. Data skip. Triple conversion, 254.4, 10.85, 0.45 MHz IFs. Excellent image rejection and intermod immunity. Fairly good audio. See "The Uniden Bearcat BC235XLT," by Bob Parnass, AJ9S, in Monitoring | Times, July 1997 or an on-line version at www.grove.net.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. NiCd pack provides about 5 hours between charges. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to

cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. See US patent 4,057,760, | granted 11/8/77. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature.

Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Z60: base/mobile sporting 60 channels, but 10 of them are for FM broadcast only. Built in alarm clock, priority, and memory which requires no battery backup. Covers 30 - 50, 88 -108, 118-136, 144-174, 440-512 MHz. Notice that it's not spec'd to cover some important federal bands: 136 - 144 and 406 - 440.

RELM

HS200: 1996 vintage. Very good 200 channel portable. 10 banks. Built-in CTCSS and DCS decoder. Lighted keypad. Duplicate channel detection. 100 frequencies can be locked out from search. Very good audio and strong front end. Excellent internal shielding. Global rescan delay. Covers CB. Fixed modes and step sizes. IFs are 280.2 and 0.45 MHz, and perhaps one in between. For a quantitative test report, see "The RELM HS-200 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1997.

Radio Shack

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035

- How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2045: 1996 vintage. Very good 200 channel base/mobile made for Radio Shack by Uniden. Tuning/channel selector knob. 10 banks, selectable attenuator, and rescan delay. CTCSS-capable with optional board. Great Auto Store. Weather alert. Scans and searches fast. Can lock out 50 frequencies during search. Step sizes fixed but AM and NFM modes are selectable. IFs are 380.7, 10.7, and 0.455 MHz. Images on VHF-high band despite high 1st IF. Some intermod on review unit. See "The Radio Shack PRO-2045," by Bob Parnass, AJ9S, in Monitoring Times, February 1997.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels. Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search. See "The Radio Shack PRO-2046," by Bob Parnass, AJ9S, in Monitoring Times, October 1996.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells.

Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Cellular images throughout the 847.6 - 869 MHz range. Includes power saver circuit, odd for a base unit, which can clip the first part of a transmission. See September 1996 Monitoring Times for modifications.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite

limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-26: 1995 vintage. (Not to be confused with a simple 1985 crystal controlled portable bearing the same model number.) Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S,

in Monitoring Times, August 1995.

PRO-62: 1994 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO-64: 1997 vintage. Good portable 400 channel scanner using up conversion. Replaces PRO-62 and has many more features. Selectable AM/NFM modes but fixed step sizes. 10 search banks which can be cascaded. Auto store saves unique frequencies found during a search. Frequencies can be loaded using a computer but optional interface kit not yet available. Can recharge Radio Shack's optional, monolithic NiCd pack, but not AA cells within the scanner. IFs are 257.5, 21.4, and 0.455 MHz.

PRO-30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

Craig (division of Pioneer)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Sonar

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2516	10	X		yes	yes
FR2517	10	X		yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

Tennelec

Manufactured the first synthesized scanners. See US patents | 3,961,261 and 3,962,644, granted 6/1/76 and 6/8/76 | respectively. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the

locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

After having swapped my defective Pro-60 for a fresh one I had the opportunity to enjoy it fully at an airshow yesterday. What amazes me it that for a circuit without a transmitter it sure eats a set of batteries rather quickly.

Other than carrying six extra AA's with me I've considered getting either a second battery holder or perhaps the rechargeable battery pack from RS. As to the latter I'm wondering if the rechargeable set lasts longer than the standard batteries? In the long run are they really any more cost effective?

zaax@aol.com (ZaaX) asked:
> .... The Indiana & Ohio Railroad (ex DT&I, ex GTW) runs north and
> south from Delta. .... what radio frequencies they use?

My references don't show the Indiana & Ohio operating north of Springfield. The only portion of the ex-Grand Trunk (ex DT&I) shown is from Springfield south to Washington Court House, operated as the Indiana & Ohio Central Railroad. Assuming the INOH has acquired part of the Springfield/Lima/Detroit route from GTW, you might try:

161.385 (160.575 i/p) INOH - I & O general ops
161.295 (160.695 i/p) IOCR - I & O Central general ops (also IOER)
161.220 GTW - Grand Trunk Ch 5 road (former GTI)

(frequencies from the Compendium of American R.R. Frequencies)

5970. Television Remote Control Extender

Newsgroup: rec.radio.scanner
Date: 1997-06-30 00:00:00 UTC
From: gwheelerX@gate.net
Message-ID: <33b7cdd2.319493477@news.gate.net>
Source record: 192892
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I have a gizmo which "extends" the range of my TV remote control by watching for the infrared signal, transmitting it as an RF signal, then a receiver unit picks up the RF and converts it back to infrared. I decided to hunt for the frequency used by the sender unit, but my results were strange.

I found the signal at several frequencies, from 30.000 MHz to 56.000 MHz, every two MHz (30, 32, 34, etc.) except for a couple of frequencies where it was missing. I know this was the correct signal, because it stopped whenever I stopped using the remote control. (That's a rather nice feature -- it doesn't transmit during the non-use time.)

So, I'm not sure if it really transmits on all those frequencies (some sort of spread spectrum technique?), or if some of the frequencies are just images picked up by my scanner (all of them? why at 2 MHz intervals?), or what.

Of course, there's little point in receiving this signal anyway. It's just some digital noise, but I'm the curious sort.

Good? Not really. Decent? Yes.

> What kind of scanner can do all of this without me having to part with an
> arm and a leg?

Since you will be just visiting, I assume you are only looking for something new and not used. The AR8000 is no longer sold here(for the time being) so that's out. The Yupiterus are illegal to import for sale so you can't buy one of those here. Which leaves the Icom R10 if you have to have HF coverage. This radio is about the cheapest of the bunch right now and runs around $500 US. Some people would call that an arm and a leg.

Your other choices are base/desktop models and for HF coverage we're taking Icom or AOR and anywhere from $1000 to $2000 US. I'll assume you aren't interested in these.

Other than this, you will have to forget about HF coverage to bring the price down. Then you can pick up a good model for $200 - $350 US from either RELM, Uniden or Radio Shack.

> By the way, is there a FAQ or some other source of general information
> about scanners on the net? I'd like to know more about this.

Not really a FAQ. There are a bunch of FAQs posted to the newsgroups on varying subjects pertaining to scanning. Try doing a search on "scanner" and various model identifiers using a web search engine.

You might also want to have a look at my web page below and poke around in there. I'm sure you won't be disappointed!

Best of luck and enjoy your visit to the US!

Don't think a scanner is what you need. There are only about
three models that have weather alert. None of them are "cheap"
and have much more than 10 channels.

Sounds like you want a plain old Radio Shack weather alert
radio.

5976. Re: Mercy Air or any EMS Helicopters in S. Cal

Newsgroup: rec.radio.scanner
Date: 1997-06-30 00:00:00 UTC
From: bbhickok@aol.com
Message-ID: <19970630193400.PAA29771@ladder02.news.aol.com>
Source record: 192898

I came late into this response so I don't know what's been said earlier.
I've got Southern Cal Mercy Air at 155.220

5977. FS:Icom W2A HT ham radio w/ cellular

Newsgroup: rec.radio.scanner
Date: 1997-06-30 00:00:00 UTC
From: jwh7k@avery.med.Virginia.EDU
Message-ID: <ECLrqH.HKH@murdoch.acc.Virginia.EDU>
Source record: 192899

ICOM IC-W2A dualband FM handheld transceiver

ICOM BP-84 rechargable battery pack

ICOM BP-90 battery pack, six AA batteries

ICOM FA-1443B VHF/UHF antenna, 8" rubber duck

ICOM HS-60 VOX headset, with dual band earphones

ICOM CP-13 car lighter adapter, 12 VDC, 2 amp

ICOM BC-77A AC wall charger

The HT is in good working order. The body is in fair condition with
a few scratches on the display (does not effect readability of display)
and dings on the body. The rechargable battery pack will hold a charge,
but not for long. Includes manual and info on mods. Has been modified
for expanded receiver frequency ranges of: 118-170MHz, 322-513MHz, and
800-970MHz (receives cell phone).

$200US or best offer plus shipping.

Email jwh7k@virginia.edu. Thanks...

Jack,
Onexample:
Enter Rusty Wallace into ch.2, D.E. into ch.3, S.M. ch.h.4, etc.
This way, if your scanner stops on ch.6, you know you are hearing Mark Martin.
Also, as drivers drop out due to engine, crash, whatever, you can lock out
their freqs.(channels)
Or, if Jeff Gordon, for instance, starts slowing down, p ch. 24
24 in and hear the reason why.
Hope you have a good set of headphones. Ordinary, walkman type won't
work, and HAVE FUN, that's the main thing. Believe it or not, scanning

the entire race can actually distrafrom the race.e race.
Phil

I would like to thank those who helped me on the bc200 mods to my scanner and the low bat fix. its like having a new scanner. Idecided to still buy the bc3000xt but I am not going to sell my 200 xlt because it works excellent.

I have had it 7 years and I never would fill all banks because what I listen to cops,weather,cordless, would fit in the 1st 4 banks.

Now with the cell mod I filled 9 banks with cell freqs no birdies , and my favorites thinned out as well as all 20 cordless and brought this old scanner back to life

again guys and gals a hearty thanks

That they do... but they are really just a good exercise in soldering.
One would be better off with a North Counry Radio MPX96 or a Veronica PLL
(www.northcountryradio.com and www.ldbrewer.com respectively.) I've built
all of these and for a little more money you can actually get a really
nice signal and (*ahem*) way bitchin' sound.

Same with me until I couldn't stand it anymore. I bought a BC 3000 last year and have never regretted it. Great performer, mil air, lock out on search, etc....

But...

I live in an area where almost everything is trunked and I got tired of missing events.... If you don't need the mil air go with the 235, if you want to hear mil air too, buy both. I'm in the military and I take the 3000 with me when I travel.

Gee, I'm gonna miss my wife when she finds out !!!!!

It has just been discontinued, not recalled. It will be replaced in
several months. It does not pick up cellular besides a few images.
There are no mods or tricks to this scanner. It just didn't last long
in retail and shall be replaced like everything.

Welcome,

Chair-Pak is a great idea!!!

It's a Backpack AND a built-in Chair!!!

See it at http://www.chairpak.com

3 Sizes Full Pak, Day Pak, and a Child Pak!

How many times have you gone somewhere and needed a chair ?
beach waiting in line with friends
hiking around the campfire conventions
air shows at the park in line at the DMV
outdoor concerts hiking trails car shows
camping on campus reading at the poo l /beach
fishing trekking rest areas
poetry readings jams outdoor games
outdoor sport events story telling to children picnics
theme parks national parks hunting
backyard outdoor weddings and anywhere you want to SIT!!!

Carry your stuff and your chair where ever you go!!!

Where do you want to sit today?

Chair-Pak is made of the strong durable Dupont Cordura and the frame is of strong and light T6 aluminum.

If you would like to order, or get more information about Chair-Pak, please visit our web site

When I was a newspaper photographer in Athens, Ohio, I'd stop
by to shoot the fat with the dispatcher late at night. There was a
wide spot right in front of the courthouse that you could park if the
cops knew you.

One night I was making my normal visit when a car asked for a
license check.

"I'll save you the trouble, Andy," I told the dispatcher.
"That's my new car and I'm parked right out front. He probably just
doesn't recognize it."

Before he could reply, the car radioed back in, "Uh, could you
hurry up with the license check.... I'm in pursuit and it's running
about 105 down Rt. 33."

I ran out the door at that point and, you guessed it, the cop
was waiting across the street to catch my reaction.

One more:

I never saw this myself, but there's an urban legend about a
guy who had a personalized license that read, "NO TAG." Whenever he
got a parking ticket the clerk would trash it because there was no way
he could find the owner if the car had "no tag."

From the FAQ article SCANNER RADIO REVIEW BRIEFS:

[...]

K500: Nice wood-like cabinet. 40 channel model with every
feature Regency could dream of in one scanner, except
aircraft band. Idle tone bypass feature for mobile phone
stations works about 50% of the time. Weather alert feature.
Service Search in several banks. Search and Store facility
not implemented as well as BC250, but better than none.
Built in clock when radio off or in manual mode. Can be
programmed out of band. Reasonable performance, but
sensitivity could be better. Spring contacts on membrane
keyboard may need soldering after prolonged use.

[...]

LAPD radios use simplex on the repeater output... This wy they can talk short distances without losing the ability to hear calls. If the need to hear calls is not important and they are close they will go to a "TAC" channel and use it simplex, as long as distance permits...

All of the tac channels are city wide, so if distance permits they use simplex. Part of the ongoing radio system upgrade will increase the number of tac channels available from four to fourteen......

> Hey Bill,,

I don't know who feeds you such BS. I've been stationed there as an Active Duty soldier since April of 93 with the 319th Signal Battalion. I

can assure you that there are no plans to shut down or close the only Reserve Forces Training Activity on the west coast. On the contrary, a brand new Battle Projection Center is set to open in July. Battle Simulation for the Reserve Forces in a very highly computerized setting.

The Military Intelligence Community just opened up last year a multi force Regional Training Activity for the Navy, Air Force and Army. The CANG is scheduled to break ground this year on a multi million dollar maintenance facility. The barracks, BEQs and infrastructure is being rebuilt. There is a new running track and recreation center on post and this summer as in past summers the Regional Training Site-Medical has a field hospital set up doing rotations with Reserve Medical Units (who almost make up 75% of the Active Duty Medical Forces). Read the papers, listen to the news..who is called up now when there is a crisis. The reserves and National Guard... Congress has cut back so much that almost

all Combat Support Services are provided by these weekend soldiers who are called up to augment the severely undermanned active forces.

I am a digital switching supervisor with the 319th Signal Battalion. The

only Reserve Signal Battalion besides the one at Ft Lewis left on the west Coast. We are an Echelon Above Corps signal unit that can provide medium to long haul communications for any scenario, ie natural disasters, wars, etc.. We have been fielded with brand new digital equipment from GTE . I myself operate with my team a digital switch which is capable of providing phone service to 720 individual subscribers independent of the local and long distant carriers, when hooked up with TACSAT or Tropo equipment.

The post is open. Come in and look around and then write me and let me know why you think that Camp Parks is going away ..

Oh and by the way, Dublin PD is on the ALCO system or Robert Kelty, Monitor America, Police CAll and all the other publications are wrong too. Wake up buddy !!! Hello, is there anybody there !!!.....

Message-ID: <33b99c2b.59832612@news.usit.net>
Source record: 193022
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I will be bringing my new scanner to the Pepsi 400, and have several questions about scanning at a race.

1. If you scan more than a couple of cars, how do you know who is who? I don't want to spend more time watching the scanner than watching the race.

2. Are the NASCAR frequencies worth monitoring? Which ones? What kind of info comes over them?

464.5000, 464.9000, 464.7750, 464.0250, 463.8500, 461.2000, 463.6250, 468.2500, 461.2000, 463.6250, 463.8500, 465.0250

3. What is on the MRN Radio frequency (454.0000), their entire broadcast?

4. What is on the ESPN frequency (450.3500)?

In other words, what is the strategy for scanning, without spending a lot of time messing with the scanner (all of my spare time is spent reaching into the beer cooler)?

Thanks

NC state HP uses a low-band, two freq simplex system for most dispatch. You
must monitor both base and mobile freqs to hear both sides of a conversation.
Car to car traffic uses the "base" side of the pair. I believe there are sixteen
pairs or channels in use of which I can remember these:

Chnl Mobile Base
F1 42.78 42.62
F3 42.80 42.52
F5
F7 42.76 42.64
F9 42.70 42.50

There is also a high band network that is repeaterised or 1F simplex on 154.680.
Use of channels varies by HP district, you need a map such as is published in
some scanner books tro show channel deployment. Other agencies such as
DMV, SBI, and corrections have low-band channels of their own as well as inter-
op with HP.

Hey I thought the same thing when I saw 100 mA draw! That sure seams high
for a battery powered device! But a 600 mA/hr NiCad lasts about 6 hours..
Sure works out right!
So in theory the 1100 mAHr NiMH batteries should give 11 hours. I havn;tt
tried them yet, I bought the RS scanner and $35 20-288 batttery together,
when it dies I'll buy the NiMH cells..

I own a Sanyo 900b Mhz Cordless, Digital, Spread Spectrum.
I can get it to reach about 4 blocks before it cuts me off.
A very nice, "private" phone. My pro 2006 can pick it up...but it is all
digital audio....no voice is ever detected.

At the TRW Ham radio swap meet in El Segundo, these are priced at $165 to
$200.
I don't know how many are selling at those prices, but several tables are
asking the same.

H Higgins

PS. A few months ago, I seem to recall people asking $135 to about $165.

Oh, great. Yet another reason to spend kilobucks on avionics for my airplane... By the way, do these folks have any idea how I'm supposed to maintain enough stability so that I don't bleed on to other channels? With all the temperature extremes my airplane sees, will I also be required to calibrate my radios every six months?

The biggest problem with aviation communications today is not so much that there aren't enough channels. It is that if we subdivide the busy airspace any more, I'll spend more time fiddling with the radio than I will flying the airplane. Even now it's pretty bad. I'm not convinced that more channels are the answer.

>>>Also, probably switching from AM to TDMA as well.
>>
>>First I've heard about this. It's not likely, given the literally

Like Mode S, it sounds like a flop. Mode S is one of the biggest turkeys since MLS. Yeah, it's real, and yes it works. But it's expensive as *&%^. Not many folks I know think it'll happen until it gets a whole lot cheaper. Frankly, there has to be a better way of handling this problem...
